Preface

Welcome to the Trend Micro™ Worry-Free™ Business Security Installation and Upgrade Guide. This document discusses requirements and procedures for:

• Installing the Security Server
• Upgrading the Security Server and agents

For information on installing agents, see the Administrator’s Guide.
Worry-Free Business Security documentation includes the following:

### Table 1. Worry-Free Business Security Documentation

<table>

</tbody>
</table>

- **Installation and Upgrade Guide**: A PDF document that discusses requirements and procedures for installing the Security Server, and upgrading the server and agents.
- **Administrator’s Guide**: A PDF document that discusses getting started information, client installation procedures, and Security Server and agent management.
- **Help**: HTML files compiled in WebHelp or CHM format that provide "how to's", usage advice, and field-specific information.
- **Readme file**: Contains a list of known issues and basic installation steps. It may also contain late-breaking product information not found in the Help or printed documentation.
- **Knowledge Base**: An online database of problem-solving and troubleshooting information. It provides the latest information about known product issues. To access the Knowledge Base, go to the following website: [http://esupport.trendmicro.com/en-us/business/default.aspx](http://esupport.trendmicro.com/en-us/business/default.aspx)

Download the latest version of the PDF documents and readme at:

### Audience

Worry-Free Business Security documentation is intended for the following users:

- **Security Administrators**: Responsible for Worry-Free Business Security management, including Security Server and agent installation and management. These users are expected to have advanced networking and server management knowledge.
• **End users**: Users who have the Security Agent installed on their computers. The computer skill level of these individuals ranges from beginner to power user.

### Document Conventions

To help you locate and interpret information easily, the Worry-Free Business Security documentation uses the following conventions:

#### Table 2. Document Conventions

<table>
<thead>
<tr>

Chapter 1

Preparing for Installation and Upgrade

This chapter discusses the preparations needed before installing or upgrading Worry-Free™ Business Security.
Product Editions

Trend Micro offers the following editions:

- **Worry-Free Business Security Standard**: Designed to protect clients (desktops, portable computers, and servers) on your local network. This edition includes Outbreak Defense, Firewall, and Antivirus/Anti-spyware scanning. It also comes with technical support, malware/virus pattern file downloads, real-time scanning, and program updates for one year.

- **Worry-Free Business Security Advanced**: Designed to protect clients and Microsoft Exchange servers on your network. In addition to all the features in Worry-Free Business Security Standard, this edition includes Anti-spam, Content Filtering, Data Loss Prevention, and Attachment Blocking.

The following table lists the features supported for each edition.

**Table 1-1. Features Available by Product Editions**

### Licenses, Registration, and Activation

When you purchase Worry-Free Business Security, you receive a license for the product(s) and a standard Maintenance Agreement. The standard Maintenance Agreement is a contract between your organization and Trend Micro regarding your right to receive technical support and product updates in consideration for the payment of applicable fees.

A license to the Trend Micro software usually includes the right to product updates, pattern file updates, and basic technical support for one (1) year from the date of purchase. After the first year, you must renew the Maintenance Agreement annually against then-current Trend Micro maintenance fees.

*Note*

The Maintenance Agreement expires, but your License Agreement does not. If the Maintenance Agreement expires, scanning can still occur, but you will not be able to update the malware/virus pattern files, scan engine, or program files (even manually). Nor will you be entitled to receive technical support from Trend Micro.

Register and activate your Worry-Free Business Security license to enable the full functionality of the product.
Registration Key

A Registration Key comes with your purchase of Worry-Free Business Security. It has 22 characters (including hyphens) and is in the following format:

xx-xxxx-xxxxx-xxxxx-xxxxx

Note

If you purchase the Trend Micro SMB Solution CD, you can find an evaluation Registration Key on the package.

Activation Code

After registering, you will receive a fully licensed Activation Code through email. An Activation Code has 37 characters (including the hyphens) and is in the following format:

xx-xxxx-xxxxx-xxxxx-xxxxx-xxxxx-xxxxx

During the Security Server installation, type the Activation Code when prompted. If you leave the field empty, Worry-Free Business Security installs the 30-day evaluation version. Upgrade to the fully licensed version before the evaluation version expires.

License Status

The following table lists the features supported according to the license status.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Fully Licensed</th>
<th>Evaluation (30 Days)</th>
<th>Expired</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expiration Notification</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Component Updates</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Program Updates</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
When a fully licensed Activation Code expires, you can no longer download scan engine or pattern file updates. However, unlike an evaluation version Activation Code, when a fully licensed version Activation Code expires, all existing configurations and other settings remain in force. This provision maintains a level of protection in case you accidentally allow your license to expire.

You can renew a full version of Worry-Free Business Security by purchasing a maintenance renewal. You need an Activation Code to install the full versions.

If you have questions about the registration process, please consult the Trend Micro support website at:

http://esupport.trendmicro.com/support/viewxml.do?ContentID=en-116326

### The Worry-Free Business Security Network

Worry-Free Business Security is comprised of the following:

- *Security Server on page 1-5*
- *Agents on page 1-7*
- *Web Console on page 1-7*

### Security Server

At the center of Worry-Free Business Security is the Security Server. The Security Server hosts the web console, the centralized web-based management console for Worry-Free Business Security. The Security Server installs agents to clients on the network and along
with the agents, forms an agent-server relationship. The Security Server enables viewing security status information, viewing agents, configuring system security, and downloading components from a centralized location. The Security Server also contains the database where it stores logs of detected Internet threats being reported to it by the agents.

The Security Server performs these important functions:

- Installs, monitors, and manages agents.
- Downloads the components needed by agents. By default, the Security Server downloads components from the Trend Micro ActiveUpdate server and then distributes them to agents.

**Scan Server**

The Security Server includes a service called Scan Server, which is automatically installed during Security Server installation. As such, there is no need to install it separately. The Scan Server runs under the process name `iCRCService.exe` and appears as **Trend Micro Smart Scan Service** from Microsoft Management Console.

When Security Agents use a scan method called **smart scan**, the Scan Server helps these agents run scans more efficiently. The smart scan process can be described as follows:

- The Security Agent scans the client for security threats using the **Smart Scan Agent Pattern**, a lightweight version of the traditional Virus Pattern. The Smart Scan Agent Pattern holds most of the threat signatures available on the Virus Pattern.

- A Security Agent that cannot determine the risk of the file during the scan verifies the risk by sending a scan query to the Scan Server. The Scan Server verifies the risk using the **Smart Scan Pattern**, which holds the threat signatures not available on the Smart Scan Agent Pattern.

- The Security Agent "caches" the scan query result provided by the Scan Server to improve the scan performance.

By hosting some of the threat definitions, the Scan Server helps reduce the Security Agents’ bandwidth consumption when downloading components. Instead of downloading the Virus Pattern, Security Agents download the Smart Scan Agent Pattern, which is significantly smaller in size.
When Security Agents are unable to connect to the Scan Server, they send scan queries to the Trend Micro Smart Protection Network, which has the same function as the Scan Server.

It is not possible to uninstall the Scan Server separately from the Security Server. If you do not want to use the Scan Server:

1. On the Security Server computer, open Microsoft Management Console and disable the **Trend Micro Smart Scan Service**.

2. On the web console, switch Security Agents to conventional scan by navigating to **Preferences > Global Settings > Desktop/Server** tab and selecting the option **Disable Smart Scan Service**.

### Agents

Agents protect clients from security threats. Clients include desktops, servers, and Microsoft Exchange servers. The WFBS agents are:

**Table 1-3. WFBS Agents**

<table>
<thead>
<tr>
<th>Agent</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Agent</td>
<td>Protects desktops and servers from security threats and intrusions</td>
</tr>
<tr>
<td>Messaging Security Agent (Advanced only)</td>
<td>Protects Microsoft Exchange servers from email-borne security threats</td>
</tr>
</tbody>
</table>

An agent reports to the Security Server from which it was installed. To provide the Security Server with the very latest client information, the agent sends event status information in real time. Agents report events such as threat detection, startup, shutdown, start of a scan, and completion of an update.

### Web Console

The web console is the central point for monitoring clients throughout the corporate network. It comes with a set of default settings and values that you can configure based on your security requirements and specifications. The web console uses standard Internet technologies, such as Java, CGI, HTML, and HTTP.
Use the web console to:

- Deploy agents to clients.
- Organize agents into logical groups for simultaneous configuration and management.
- Set antivirus and anti-spyware scan configurations and start Manual Scan on a single group or on multiple groups.
- Receive notifications and view log reports for threat-related activities.
- Receive notifications and send outbreak alerts through email messages, SNMP Trap, or Windows Event Log when threats are detected on clients.
- Control outbreaks by configuring and enabling Outbreak Defense.
Chapter 2

Installing the Security Server

This chapter provides information you will need to understand in order to install the Security Server.
Installation and Upgrade Requirements

Visit the following website for a complete list of installation and upgrade requirements:

Security Server Installation Considerations

Consider the following when installing the Security Server:

- Security Server IPv6 Requirements on page 2-2
- Location of the Security Server on page 2-3
- Number of Clients on page 2-3
- Network Traffic on page 2-4
- Dedicated Server on page 2-5
- Compatibility Issues on page 2-5

Security Server IPv6 Requirements

The IPv6 requirements for the Security Server are as follows:

- The server must be installed on Windows Server 2008/2012, SBS 2008/2011, 7, 8, and Vista. It cannot be installed on Windows XP or Server/SBS 2003 because these operating systems only support IPv6 addressing partially.

- The server must use an IIS web server. Apache web server does not support IPv6 addressing.

- If the server will manage IPv4 and IPv6 agents, it must have both IPv4 and IPv6 addresses and must be identified by its host name. If a server is identified by its IPv4 address, pure IPv6 agents cannot connect to the server. The same issue occurs if pure IPv4 clients connect to a server identified by its IPv6 address.

- If the server will manage only IPv6 agents, the minimum requirement is an IPv6 address. The server can be identified by its host name or IPv6 address. When the
Installing the Security Server

server is identified by its host name, it is preferable to use its Fully Qualified Domain Name (FQDN). This is because in a pure IPv6 environment, a WINS server cannot translate a host name to its corresponding IPv6 address.

• Verify that the host machine’s IPv6 or IPv4 address can be retrieved using, for example, the “ping” or “nslookup” command.

• If you are installing the Security Server to a pure IPv6 computer, set up a dual-stack proxy server that can convert between IPv4 and IPv6 addresses (such as DeleGate). Position the proxy server between the Security Server and the Internet to allow the server to successfully connect to Trend Micro hosted services, such as the ActiveUpdate server, the Online Registration website, and Smart Protection Network.

Location of the Security Server

WFBS can accommodate a variety of network environments. For example, you can position a firewall between the Trend Micro Security Server and clients running the Security Agent, or position both the Trend Micro Security Server and all clients behind a single network firewall.

If more than one site is being managed, it is recommended that you install a Security Server at the main site, and at each managed site, to reduce bandwidth usage between the main site and managed sites, and to speed up pattern file deployment rates.

If clients have the Windows Firewall enabled, WFBS will automatically add it to the Exception list.

Note

If a firewall is located between the Trend Micro Security Server and its clients, you must configure the firewall to allow traffic between the client listening port and Trend Micro Security Server’s listening port.

Number of Clients

A client is a computer where you plan to install a Security Agent or a Messaging Security Agent. This includes desktops, servers, and portable computers, including those that belong to users who telecommute.
A single Security Server installation can manage up to 2,500 clients. If you have more clients, Trend Micro suggests installing more than one Security Server.

Network Traffic

WFBS generates network traffic when the Security Server and agents communicate with each other.

The Security Server/Scan Server generates traffic when:

• Notifying agents about configuration changes
• Notifying agents to download updated components
• Connecting to the Trend Micro ActiveUpdate server to check for and download updated components
• Responding to scan queries received from agents that use smart scan
• Sending feedback to the Trend Micro Smart Protection Network

Agents generate traffic when:

• Starting up
• Shutting down
• Generating logs
• Performing scheduled updates
• Performing manual updates (“Update Now”)
• Connecting to the Scan Server for scan queries

Note

Apart from updates, all the other actions generate a small amount of traffic.

Network Traffic during Component Updates

The Security Server generates significant network traffic when it updates a component. To reduce network traffic generated during component updates, the Security Server
performs component duplication. Instead of downloading an updated full pattern file, the Security Server only downloads the "incremental" patterns (smaller versions of the full pattern file) and merges them with the old pattern file after the download.

A Security Server that is updated regularly only downloads the incremental pattern. Otherwise, it downloads the full pattern file.

Trend Micro releases new pattern files regularly. Trend Micro also releases a new pattern file as soon as a damaging and actively circulating virus/malware is discovered.

**Using Update Agents to Reduce Network Bandwidth**

If you identify sections of your network between Security Agents and the Security Server as “low-bandwidth” or “heavy traffic”, you can specify Security Agents to act as update sources (Update Agents) for other agents. This helps distribute the burden of deploying components to all agents.

For example, if your network is segmented by location, and the network link between segments experiences a heavy traffic load, Trend Micro recommends allowing at least one Security Agent on each segment to act as an Update Agent.

**Dedicated Server**

When selecting a computer that will host the Security Server, consider the following:

- The CPU load the computer handles
- If the computer performs other functions

If the target computer has other functions, choose a computer that does not run critical or resource-intensive applications.

**Compatibility Issues**

This section explains compatibility issues that may arise with certain third-party applications. Always refer to the documentation of all third-party applications that are installed on the same computer on which you will install the Security Server and other Worry Free components.
Other Endpoint Security Software

Before installing the Security Server, Trend Micro recommends manually removing other endpoint security software from the target computer as this may block the installation or influence the Security Server’s performance later after installation.

Security Applications in Windows SBS and EBS 2008

WFBS is compatible with both Windows Small Business Server (SBS) 2008 and Windows Essential Business Server (EBS) 2008. However, some security applications that are either installed with or managed through these operating systems may conflict with WFBS. For this reason, you may need to remove these security applications.

Messaging Security Agent and Forefront

The Messaging Security Agent cannot be installed on Microsoft Exchange servers that have Forefront (Microsoft Forefront Security for Exchange Server) installed. Uninstall Forefront and ensure that the Microsoft Exchange Information Store service is started before installing the Messaging Security Agent.

Security Agents and OneCare

Although the Security Server can be installed with Microsoft Windows Live™ OneCare for Server, the Security Agent cannot be installed with the OneCare client. The Security Agent installer will automatically remove OneCare from clients.

Databases

Scanning databases may decrease the performance of applications that access the databases. Trend Micro recommends excluding databases and their backup folders from Real-time Scan. If you need to scan a database, perform a Manual Scan or schedule a scan during off-peak hours to minimize the impact.

Other Firewall Applications

Trend Micro recommends removing or disabling any other firewall applications prior to installing the WFBS firewall, including:

• Windows Internet Connection Firewall (ICF)
• Windows Firewall (WF)

However, if you want to run ICF or any other third-party firewall, add the Trend Micro Security Server listening ports to the firewall exception list (see WFBS Ports on page 2-7).
for information on listening ports and refer to your firewall documentation for details on how to configure exception lists).

WFBS Ports

WFBS uses the following ports:

- **Server listening port (HTTP port):** Used to access the Security Server. By default, WFBS uses one of the following:
  - **IIS server default website:** The same port number as your HTTP server’s TCP port.
  - **IIS server virtual website:** 8059
  - **Apache server:** 8059
- **Client listening port:** A randomly generated port number through which the Security Agent and Messaging Security Agent receive commands from the Security Server.

You can modify the listening ports only during the installation.

---

**WARNING!**

Today’s cyber criminals use HTTP and direct their attacks at ports 80 and/or 8080 – commonly used in most organizations as the default Transmission Control Protocol (TCP) ports for HTTP communications. If your organization is currently using one of these ports as the HTTP port, Trend Micro recommends using another port number.

---

**Note**

To find out which port your Security Agents are using to connect to the Scan Server, open SSCFG.ini in the folder where the server is installed.

- **Scan Server ports:** Used by the Scan Server to communicate with Security Agents for scan queries.
### Table 2-1. Scan Server Ports

- **Trend Micro Security (for Mac) Communication port**: Used by the Trend Micro Security (for Mac) server to communicate with Mac clients. The default is port 61617.

  **Note**
  Trend Micro Security (for Mac) is a WFBS plug-in and is licensed separately. Contact your Trend Micro representative for inquiries about this plug-in.

- **SMTP port**: Used by the Security Server to send reports and notifications to administrators through email. The default is port 25.

- **Proxy port**: Used for connections through a proxy server.

### Installation Checklist

<tr>
<td></td>
<td>• Messaging Security Agent installation location</td>
</tr>
</tbody>
</table>
Phase 3: Installation Process

Wait for the installation to finish and then close Setup.

<table>
<thead>
<tr>
<th>Phases</th>
<th>Key Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase 3: Installation Process</td>
<td>Wait for the installation to finish and then close Setup.</td>
</tr>
</tbody>
</table>

Phase 1: Starting the Security Server Installation

Before you begin

• Log on to the computer using an account with either domain or local administrator privileges.

• Close any running applications before installing WFBS. If you install while other applications are running, the installation process may take longer to complete.

• Make sure that you do not install the Security Server on a computer that is running applications that might lock IIS. This could prevent successful installation. See your IIS documentation for more information.

• Installing the Trend Micro Security Server does not require you to restart the computer. After completing the installation, immediately configure settings on the web console and then proceed to install the Security Agent to clients.
Launch the Installation Package

Double-click the installation package (.exe file).

The installation files will be extracted to the same directory where the .exe file is located. To change the path, click Browse and then locate the directory.

When you click Start, Setup begins to extract the files. The extraction status displays in the status bar at the bottom of the screen. When extraction is complete, the Welcome screen displays.

The wizard will guide you through the installation of the application on your computer. To continue, click Next.

Note: Trend Micro recommends closing all other browser windows and applications before clicking Next.
License Agreement

Read the license agreement. If you agree with the terms, select I accept the terms of the license agreement.
Setup Type

Choose one of the following options:

**Typical Installation (Recommended)**

This method is suitable on a Security Server managing up to 100 agents.

During a Typical Installation:

- The following features are automatically enabled after the installation:
  - Antivirus/Anti-spyware
  - Behavior Monitoring (only on desktop platforms, such as Windows 7)
  - Web Reputation
Installing the Security Server

• URL Filtering

• Smart Scan

Note
Security Agents must meet the minimum system requirements to run smart scan. For a list of requirements, visit http://docs.trendmicro.com/en-us/smb/worry-free-business-security.aspx.

• If not present, the Security Agent is automatically installed on the same computer as the Security Server.

Note
Install the Security Agent to other clients in the network and manage them from the web console. See the Administrator’s Guide for details on the different Security Agent installation methods.

• If another endpoint security software is installed on the computer, Setup first uninstalls the software and then installs the Security Agent.

Note
Some endpoint security software can only be detected but not uninstalled. In this case, manually uninstall the software first.

Visit the following website for a list of endpoint security software that can be uninstalled or detected only but not uninstalled:

Minimal Installation

During a Minimal Installation:

• Only the Antivirus/Anti-spyware feature is enabled after the installation.

• If not present, the Security Agent is automatically installed on the same computer as the Security Server.
Note

Install the Security Agent to other clients in the network and manage them from the web console. See the Administrator’s Guide for details on the different Security Agent installation methods.

• If another endpoint security software is installed on the computer, Setup first uninstalls the software and then installs the Security Agent.

Note

Some endpoint security software can only be detected but not uninstalled. In this case, manually uninstall the software first.

Visit the following website for a list of endpoint security software that can be uninstalled or detected only but not uninstalled:

Custom Installation

With Custom Installation, you have the added flexibility of configuring settings for the Security Server and agents according to your network security strategy. This method is suitable if the Security Server will manage a large number of agents.

During a Custom Installation, the following settings are optional:

• If not present, install the Security Agent on the same computer as the Security Server.

Note

Install the Security Agent to other clients in the network and manage them from the web console. See the Administrator’s Guide for details on the different Security Agent installation methods.

• If another endpoint security software is installed on the computer, Setup first uninstalls the software and then installs the Security Agent.
Installing the Security Server

Note

Some endpoint security software can only be detected but not uninstalled. In this case, manually uninstall the software first.

Visit the following website for a list of endpoint security software that can be uninstalled or detected only but not uninstalled:

- Install the Messaging Security Agent on the same computer as the Security Server (if a Microsoft Exchange server exists) or to remote clients.

Product Activation

Type the Activation Code in the Activation Code field.
If you do not have an Activation Code, you may not have registered your copy of WFBS yet. Click the **Register Online** button to open a new browser window. Follow the instructions on the Registration screen. Alternatively, click **Next** to install the evaluation version. If you upgrade to the full version before the 30-day evaluation period ends, all your program settings will remain.

**Setup Overview**

The Setup Overview screen shows the components that you need to configure in order to install the Trend Micro Security Server, the Security Agent, or the Messaging Security Agent.

After you click **Next**:

- If you chose Typical/Minimal Installation, proceed to:
Phase 2: Configuring Settings According to Setup Type

The settings you need to configure in Phase 2 depend on the Setup type you chose in Phase 1.

- Configuring Settings for a Typical or Minimal Installation on page 2-23
- Configuring Settings for a Custom Installation on page 2-28

Configuring Settings for a Typical or Minimal Installation

If you are performing a Typical or Minimal Installation, the following screens appear sequentially:
Installation Location

The default WFBS install folder is \Program Files\Trend Micro\Security Server or \Program Files (x86)\Trend Micro\Security Server. Click Browse if you want to install WFBS in another folder.
Administrator Account Password

Specify different passwords for the Security Server web console and the Security Agent.

- **Security Server Web Console**: Required to log on the Web Console
- **Security Agents**: Required to uninstall or unload Security Agents from clients

**Note**

The password field holds 1 – 24 characters and is case sensitive.
SMTP Server and Notification Recipients

Specify the following information:

- **SMTP server**: The IP address of your email server

  **Note**
  
  If the SMTP server is on the same computer as WFBS and uses port 25, the installation program detects the name of the SMTP server and updates the SMTP Server and Port fields.

- **Port**: The port that the SMTP server uses for communications
• **Recipient(s):** The email address(es) that the SMTP server uses to send alert notifications. You can enter multiple email addresses when more than one person needs to receive notifications.

Refer to your ISP mail server settings. If you do not know these settings, proceed with the next step. You can update the SMTP settings after installation. Refer to the Administrator’s Guide for instructions.

**Smart Protection Network**

Choose whether you want to participate in the Trend Micro Smart Protection Network feedback program.

This optional feature provides feedback to Trend Micro about malware infections. Trend Micro recommends leaving the default value enabled as it uses WFBS feedback.
data across the world to increase the effectiveness of its anti-malware solutions. You can choose to cancel participation through the web console later.

Configuring Settings for a Custom Installation

If you are performing a Custom Installation, the following screens appear sequentially:

Installation Location

The default WFBS install folder is \Program Files\Trend Micro\Security Server or \Program Files (x86)\Trend Micro\Security Server. Click Browse if you want to install WFBS in another folder.
Select **Use install location** to store the Scan Server database to the same folder as the Security Server or select **Specify a different location** and type the absolute path to another location on the Security Server. It is not possible to specify a mapped drive or UNC path.
Select Components

Select the components that you want to install on the target computer:

- **Security Server** (Required): The Security Server hosts the centralized web console
- **Security Agent** (Optional): The agent that protects desktops and servers
- **Messaging Security Agent** (Optional): When installing the Security Server on a computer that has a Microsoft Exchange server installed on the same computer, Setup prompts you to install a local Messaging Security Agent (Advanced only).
- **Remote Messaging Security Agent** (optional): When installing the Security Server on a computer that cannot detect the existence of local Microsoft Exchange servers, Setup prompts you to install the remote Messaging Security Agent to remote servers (Advanced only).
Note

If there is an Exchange server on the same computer to which you are installing the Security Server, the remote Messaging Security Agent will not show on the Select Components screen; only the local Messaging Security Agent will show.

Configure Security Server

The Configure Security Server screen introduces the Security Server settings that you need to configure.
Web Server

For a fresh installation, Setup checks if a web server exists on the target computer.
<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setup detects both IIS and Apache web servers</td>
<td>• For a typical or minimal installation, Setup automatically uses IIS.</td>
<td>If the computer runs Windows Vista, 7, or 8, Trend Micro recommends a custom installation and choosing Apache as the web server.</td>
</tr>
<tr>
<td></td>
<td>• For a custom installation:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Setup automatically uses IIS if the Apache web server version is not supported (only versions 2.0.54, 2.0.55, and 2.0.6x are supported)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• You can choose either of the two web servers if the Apache web server version is supported.</td>
<td></td>
</tr>
<tr>
<td>Setup detects only an IIS web server</td>
<td>• For a typical or minimal installation, Setup automatically uses IIS.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For a custom installation, you can choose either of the two web servers. If you choose Apache, Setup automatically installs Apache version 2.0.64.</td>
<td></td>
</tr>
<tr>
<td>Scenario</td>
<td>Result</td>
<td>Notes</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Setup detects only an Apache web server | • Setup uses Apache if the Apache version is 2.0.54, 2.0.55, or 2.0.6x.  
  • Installation cannot proceed if other Apache versions exist. Consider the following actions:  
  • Uninstall Apache if no application is using it.  
  • Upgrade Apache to version 2.0.54, 2.0.55, or 2.0.6x if any of these versions is compatible with the applications that use Apache.  
  • Choose another computer on which to install the Security Server. | The following platforms have IIS and are supported by the Security Server:  
  • Windows Server 2003  
  • Windows SBS 2003  
  • Windows Home Server  
  • Windows Server 2008  
  • Windows SBS 2008  
  • Windows EBS 2008  
  • Windows Server 2008 R2  
  • Windows SBS 2011 Standard or Essentials  
  • Windows Server 2012  
  If Setup cannot detect IIS on these platforms, IIS may have been disabled (by default or by the system administrator). Enable IIS in this case. |
| Setup detects neither web server  | Setup automatically installs Apache web server 2.0.64.                |                                                                      |

For upgrades, if Apache is currently used as web server:

- Setup automatically upgrades the Apache version to 2.0.64 if the Apache web server was installed by the WFBS 6.x/7.x Setup program.
- Setup keeps the existing Apache version if it was installed by other programs.
Administrator Account Password

Specify different passwords for the Security Server web console and the Security Agent.

- **Security Server Web Console**: Required to log on the Web Console
- **Security Agents**: Required to uninstall or unload Security Agents from clients

**Note**
The password field holds 1 – 24 characters and is case sensitive.
SMTP Server and Notification Recipients

Specify the following information:

- **SMTP server**: The IP address of your email server

  **Note**
  
  If the SMTP server is on the same computer as WFBS and uses port 25, the installation program detects the name of the SMTP server and updates the SMTP Server and Port fields.

- **Port**: The port that the SMTP server uses for communications
• **Recipient(s):** The email address(es) that the SMTP server uses to send alert notifications. You can enter multiple email addresses when more than one person needs to receive notifications.

Refer to your ISP mail server settings. If you do not know these settings, proceed with the next step. You can update the SMTP settings after installation. Refer to the Administrator’s Guide for instructions.

**Smart Protection Network**

Choose whether you want to participate in the Trend Micro Smart Protection Network feedback program.

This optional feature provides feedback to Trend Micro about malware infections. Trend Micro recommends leaving the default value enabled as it uses WFBS feedback.
data across the world to increase the effectiveness of its anti-malware solutions. You can choose to cancel participation through the web console later.

General Proxy Settings

If a proxy server is required to access the Internet, select the **Use a proxy server** check box and provide the following information:

- **Proxy server type**
- **Server name or IP address**
- **Port**
• **User name and Password**: provide only if the proxy server requires authentication

**Configure Security Agent**

The Configure Security Agent screen introduces the Security Agent settings that you need to configure.

After installing the Security Server, install the Security Agent to clients in the network. For details on the different Security Agent installation methods, see the Administrator’s Guide.
Security Agent Installation Path

Set the following items:

- **Installation Path**: The destination folder where the Security Agent files are installed

- **Security Agent Listening Port**: The port number used for Security Agent and Security Server communications
Security Agent Settings

Configure Security Agent settings for Servers and Desktops.

- **Servers**: Security Agents running Windows server platforms (such as Windows Server 2008) will be added to the default Servers group when you first add them to the Web Console. You can enable different technologies for this group based on your particular needs.

- **Desktops**: Security Agents running Windows desktop platforms (such as Windows Vista) will be added to the default Desktops group when you first add them to the Web Console. You can enable different technologies for this group based on your particular needs.

In each group, you can configure the following components:
• **Smart Scan**: Smart Scan uses a central scan server on the network to take some of the burden of the scanning of clients.

• **Antivirus and Anti-Spyware**: Scans files for malicious code as they are accessed or created

• **Firewall**: Protects clients against malware attacks and network viruses by creating a barrier between the clients and the network

• **Web Reputation**: Blocks malicious websites through the credibility of Web domains and assigning a reputation score based on several identifying factors

• **URL Filtering**: Blocks specified categories of websites (for example, pornographic, social networking) according to your company’s policy

• **Behavior Monitoring**: Analyzes program behavior to proactively detect known and unknown threats

• **Trusted Program**: Allows frequently used I/O applications to be configured from the user interface

• **Device Control**: Regulates access to external storage devices and network resources
Proxy Settings for Additional Services

The **Smart Scan**, **Web Reputation**, and **Behavior Monitoring** services use the proxy server address and port used by Internet Explorer on client computers. If that proxy server requires authentication, use this screen to specify logon credentials.

---

**Configure Messaging Security Agent**

Install Messaging Security Agent during the Security Server installation.

**Installation notes and reminders:**

- You do not need to stop or start Microsoft Exchange services before or after the installation.
• If information from a previous Messaging Security Agent installation exists on the client, you will be unable to install Messaging Security Agent successfully. Use the Windows Installer Cleanup Utility to clean up remnants of the previous installation. To download the Windows Installer Cleanup Utility, visit:

http://support.microsoft.com/kb/290301/en-us

• If you are installing the Messaging Security Agent on a server that is running lockdown tools, remove the lockdown tool so that it does not disable the IIS service and causes the installation to fail.

• The Messaging Security Agent can also be installed from the web console after the installation of the Security Server. For details, see the Administrator’s Guide.

Setup prompts you to install the Messaging Security Agent at one of the following points:
When installing the Security Server on a computer that has Microsoft Exchange server installed on the same computer, Setup prompts you to install a **local** Messaging Security Agent.
When installing the Security Server on a computer that cannot detect the existence of local Microsoft Exchange servers, Setup prompts you to install the **remote** Messaging Security Agent to remote servers.
Install Messaging Security Agent

Provide the following information:

- Exchange Server

  **Note**

  The installation program will automatically detect the name of the local Exchange server and fill in the Exchange Server field if the Exchange server is on the same computer as the Security Server. If you have an Exchange Server installed on same computer, but the Exchange Server Name is not automatically filled in, check if the environment meets the Messaging Security Agent system requirements.

- Domain Administrator Account
• **Password**

**Note**

The installer may be unable to pass passwords with special, non-alphanumeric characters to the Exchange Server computer. This will prevent installation of the Messaging Security Agent. To workaround this issue, either temporarily change the password to the built-in domain administrator account or install the Messaging Security Agent directly on the Microsoft Exchange server.

### Messaging Security Agent Settings

Configure the following:

- **Target Folder:** The folder where the Messaging Security Agent files are installed
• **Temp Folder**: The folder where Setup extracts the installation files

• **End User Quarantine**: If selected, WFBS creates a separate spam folder on Microsoft Outlook in addition to the Junk E-mail folder

• **Outlook Junk Email folder**: If selected, WFBS stores spam mail into this folder. Since Microsoft Outlook typically moves spam mail in the End User Quarantine (EUQ) folder to the Junk E-mail folder, Trend Micro recommends selecting this option.

---

**Note**

The option to select between EUQ and the Junk E-mail folder is only available if the computer is running Exchange Server 2003. On Exchange Server 2007 and 2010, the EUQ option is disabled by default.

---

After you click **Next**, the program begins installing the Messaging Security Agent.

After installing a Messaging Security Agent remotely, repeat the agent installation process to install Messaging Security Agents remotely to other Microsoft Exchange servers.
Phase 3: Installation Process

Start Copying Files

The Start Copying Files screen shows a summary of all parameters that will be used during the installation of WFBS.

Click **Back** if you wish to verify previous installation settings, or click **Next** to proceed with the actual installation.
Install Third Party Components

This screen informs you which third party components will be installed. Click **Next** to start installing the selected components.
The entire installation process may take some time to complete. During the installation, a status screen will show the progress being made.
Setup Complete

Optionally select the check boxes to:

- Open the web-based management console
- Install Remote Manager Agent (See the Administrator’s Guide for the procedure)
- View the readme file

Click **Finish** to close the install procedure.
Installing Several Security Servers Using Silent Installation

Use Silent installation to help you run multiple identical installations on separate networks. You can record the installation settings in one Setup Wizard session and then use these settings to generate automated installations.

Recording an Installation Session

Procedure

1. Download and extract the WFBS files on your hard disk. When the Setup Wizard starts with collecting installation settings, click **Cancel > Yes > Finish**.

2. In command prompt mode, navigate to the directory where the extracted WFBS setup files are located, for example: **C:\Extract\WFBS\CSM**
3. At the prompt, type `Setup.exe /r /fl"c:\silent-install.iss"` and click **Enter**.

   The Setup Wizard will start again. Your input will be recorded in the silent-install.iss file on drive C.

4. Follow the instructions on your screen. The instructions are the same as described in **Installing the Security Server on page 2-12**.

5. At the end of the recording session, the following confirmation screen appears. Click **Finish** to end the recording session and return to the command prompt mode.

   ![Confirmation Screen](image)
Starting the Silent Installation

Procedure

1. In command prompt mode, navigate to the directory where the extracted WFBS setup files are located, for example: C:\Extract\WFBS\CSM

2. At the prompt, type `Setup.exe /s /f1"c:\silent-install.iss"` and click **Enter**.

   The silent WFBS installation will automatically start and will take the same amount of time as a normal installation.

   During Silent installation, no progress indicators will be shown on your screen.

3. To verify that the installation is successful, open the `c:\setup.log` file. If `ResultCode=0`, the installation was successful.

4. Repeat steps 1 to 3 on all other computers in your network.

Verifying the Installation

Procedure

- Click **Start > All Programs** to see if the Security Server and the Security Agent appear in the list.
• Click **Start > Control Panel > Programs > Uninstall a Program** to see if the WFBS program and the Security Agent appear in the list.

• Log on to the Management Console with the server URL:  
  ```
  https://{server_name}:{port number}/SMB
  ```

---

**Note**  
If you are not using a Security Socket Layer (SSL), type `http` instead of `https`.  

---
Chapter 3

Upgrading the Security Server and Agents

This chapter provides information you will need to understand to upgrade the Security Server and Agents.
Installation and Upgrade Requirements

Visit the following website for a complete list of installation and upgrade requirements:

Upgrade Considerations

Consider the following when upgrading the Security Server and agents.

• IPv6 Requirements for Upgrades on page 3-2
• Upgrade Best Practices on page 3-3

IPv6 Requirements for Upgrades

The IPv6 requirements for the Security Server are as follows:

• The Security Server to be upgraded must be installed on Windows Server 2008, SBS 2008/2011, 7, and Vista. Security Servers on Windows XP, Server 2003, and SBS 2003 cannot be upgraded because these operating systems only support IPv6 addressing partially.

• The Security Server must already be using an IIS web server. Apache web server does not support IPv6 addressing.

• Assign an IPv6 address to the Security Server. In addition, the server must be identified by its host name, preferably its Fully Qualified Domain Name (FQDN). If the server is identified by its IPv6 address, all clients currently managed by the server will lose connection with the server. If the server is identified by its IPv4 address, it will not be able to deploy the agent to pure IPv6 clients.

• Verify that the Security Server host machine’s IPv6 or IPv4 address can be retrieved using, for example, the “ping” or “nslookup” command.
Upgrade Best Practices

You can preserve your client settings when you upgrade to the newest version of WFBS. To ensure that you can easily restore your existing settings if the upgrade is unsuccessful, Trend Micro recommends the following:

• Backing up the Security Server database
• Deleting all log files from the Security Server

Backing Up the Security Server Database

Procedure

2. In Windows Explorer, go to the Security Server folder and copy the contents of \PCCSRV\HTTPDB to another location (for example, to a different folder on the same server, to another computer, or to a removable drive).

Deleting Log Files from the Security Server

Procedure

2. Set Delete Logs Older Than to 0 for a log type.
3. Click Delete.
4. Repeat steps 2 to 3 for all log types.

Previous Version Upgrades

This product version supports upgrades from any of the following WFBS or WFBS-Advanced versions:
• 7.x (7.0 and 7SP1)
• 6.x (6.0, SP1, SP2, and SP3)

This product version does not support upgrades from any of the following:
• WFBS or WFBS-Advanced 5.x
• All upgrades that supported Windows 2000
• Client/Server Messaging Security 3.6 (except for Japanese version)
• Client/Server/Messaging Security 3.5
• Client/Server/Messaging Security 3.0
• Client/Server Security 3.0
• Client/Server Suite 2.0
• Client/Server/Messaging Suite 2.0
• OfficeScan or ScanMail for Microsoft Exchange
• One language to another

Depending on network bandwidth and the number of agents the Security Server manages, you can stagger the agent upgrade in groups or upgrade all agents immediately after the server upgrades.

**Upgrade Method 1: Using the Installation Package to Upgrade**

Obtain the installation package for this product version and then run Setup.exe on the Security Server computer. When Setup detects that an existing Security Server exists on the computer, it prompts you to upgrade, as shown in the following image.
Follow the on-screen instructions to upgrade the Security Server.

On one of the installation screens, choose from the following Security Agent upgrade options:
Trend Micro Worry-Free Business Security Setup

Upgrading the Security Agents

After completing the Security Server upgrade:

Note: All agents will upgrade even if you enable the option "Disable program upgrade and hot fix deployment" in the web console (Security Settings > {Group} > Configure > Client Privileges > Update Privileges section).

- Automatically upgrade all Security Agents in your network
- Allow clients to delay upgrading their Security Agent for maximum period of:

  2 hours

InstallShield

< Back  Next >  Cancel
### Security Agent Upgrade Option Details

<table>
<thead>
<tr>
<th>Security Agent Upgrade Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatically upgrade all Security Agents in your network</td>
<td>If you have a small number of Security Agents, allow all agents to upgrade immediately after the Security Server upgrades. All agents will upgrade, even if the option <strong>Disable Security Agent/program upgrade and hot fix deployment</strong> is enabled on the web console, in Security Settings &gt; {Group} &gt; Configure &gt; Client Privileges.</td>
</tr>
</tbody>
</table>

**Note**

The option **Disable Security Agent/program upgrade and hot fix deployment** only prevents build upgrades (for example, from the Beta build to the release build) but not version upgrades. If currently enabled, this option will automatically be disabled after the upgrade. Re-enable it as required.
Allow clients to delay upgrading their Security Agent for a maximum period of ___ hours

Select this option when upgrading a large number of Security Agents. Specify the maximum number of hours (2, 4, 8, 12, or 24 hours) to delay the upgrade.

After the Security Server upgrades, it sends upgrade notifications to all Security Agents. Users see a popup message on their computers, prompting them to upgrade.

- If users click **Upgrade Now**, the upgrade starts immediately.
- If users do nothing, the upgrade automatically starts 5 minutes after the message displays.
- If users click **Remind Me Later**, the Security Agent displays the popup message every 30 minutes until the upgrade has been started, either by the user or automatically (if users do nothing or after the maximum number of hours you specified has elapsed). The maximum number of hours takes effect when the popup message first displayed and is not reset each time the user delays the upgrade or if the client computer was shut down or restarted.

Agents that are pending upgrade still receive component updates (such as the pattern files) to keep their protection up-to-date.
Upgrading the Security Server and Agents

Upgrade Results

• Online Security Agents upgrade immediately or after a number of hours, depending on the upgrade option you selected.

• Online Messaging Security Agents upgrade immediately.

• Offline agents upgrade when they become online.
  
    • For offline Messaging Security Agents, check the connection status with the Security Server.

    • For offline Security Agents, instruct users to connect to the network so that the agent can become online. For Security Agents that are offline for an extended period of time, instruct users to uninstall the agent from the client and then use a suitable agent installation method (such as Client Packager) discussed in the Administrator’s Guide to install the agent.

Note
All previous agent settings, except Update Agent privileges, will be retained after upgrading to this version. This means that Update Agents will revert to being Security Agents after the upgrade. Reassign them as Update Agents from the management console. Refer to http://esupport.trendmicro.com/solution/en-US/1057531.aspx for details.

Upgrade Method 2: Move Agents to Security Server 8.0

Perform a fresh installation of the Security Server and then move agents (Security Agents and Messaging Security Agents) to this server. When you move the agents, they automatically upgrade to version 8.0.

Part 1: Perform a Fresh Installation of Security Server 8.0

Procedure

1. Perform a fresh installation of the Security Server on a computer. For details, see Installing the Security Server on page 2-12.
2. Record the following Security Server 8.0 information. Specify this information on the Security Server 6.x or 7.x when moving agents.
   • Host name or IP address
   • Server listening port

   The host name and listening port are found on the Security Server’s Security Settings screen, above the Tasks panel.

Part 2: Upgrade Agents

Procedure

2. To move Security Agents, select a group and then select the agents. To move a Messaging Security Agent, select it.

   Tip
   To select multiple, adjacent Security Agents, click the first agent in the range, hold down the SHIFT key, and then click the last agent in the range. To select a range of non-contiguous agents, click the first agent in the range, hold down the CTRL key, and then click the agents you want to select.

3. Click Move.

   A new screen appears.

4. Type the host name and listening port of the Security Server 8.0 to which agents will move.

5. Click Move.

Upgrade Results

• Online agents start to move and upgrade. After upgrading:
• Security Agents will be grouped under the **Desktops (default)** or **Servers (default)** group in the Security Server 8.0, depending on the operating system of the client. The agent inherits the settings of its new group.

• A Messaging Security Agent will be its own group in the Security Server 8.0 and will retain its settings.

• Offline agents upgrade when they become online.

• For offline Messaging Security Agents, check the connection status with the Security Server.

• For offline Security Agents, instruct users to connect to the network so that the agent can become online. For Security Agents that are offline for an extended period of time, instruct users to uninstall the agent from the client and then use a suitable agent installation method (such as Client Packager) discussed in the *Administrator’s Guide* to install the agent.

**Upgrades to the Full Version or the Advanced Edition**

Use the Product License screen on the web console to:

• Upgrade from the Evaluation to the Full version of the product

• Upgrade from the Standard to the Advanced Edition of the product

**Evaluation and Full Versions**

When your evaluation version is about to expire, a notification message displays on the Live Status screen on the web console. You can upgrade from an evaluation version to the fully licensed version using the Web Console. Your configuration settings will be saved. When you purchase a fully licensed version, you will receive a Registration Key or an Activation Code.

**Standard and Advanced Editions**

You can upgrade from Worry-Free Business Security to Worry-Free Business Security Advanced by obtaining an Activation Code from Trend Micro.

**Upgrading to the Full Version or the Advanced Edition**

**Procedure**

1. On the web console, navigate to Preferences > Product License.

2. If you have an Activation Code, click Enter a new code, type it in the New Activation Code field, and click Activate.

   If you do not have an Activation Code, go to the Trend Micro website at [http://olr.trendmicro.com](http://olr.trendmicro.com) to register online and obtain your Activation Code.
Appendix A

Getting Help

This appendix describes how to get help, find additional information, and contact Trend Micro.
The Trend Micro Knowledge Base

The Trend Micro Knowledge Base, maintained at the Trend Micro website, has the most up-to-date answers to product questions. You can also use Knowledge Base to submit a question if you cannot find the answer in the product documentation. Access the Knowledge Base at:

Trend Micro updates the contents of the Knowledge Base continuously and adds new solutions daily. If you are unable to find an answer, however, you can describe the problem in an email and send it directly to a Trend Micro support engineer who will investigate the issue and respond as soon as possible.

Contacting Technical Support

Before contacting Trend Micro Technical Support it is recommended that you run the Case Diagnostic Tool first (See Case Diagnostic Tool on page A-3).

Trend Micro provides technical support, pattern downloads, and program updates for one year to all registered users, after which you must purchase renewal maintenance. If you need help or just have a question, please feel free to contact us. We also welcome your comments.

- Technical Support:

- Submit a Support Case Online:

- If you prefer to communicate by email message, send a query to the following address:
  support@trendmicro.com

- In the United States, you can also call the following toll-free telephone number:
  (877) TRENDAV, or 877-873-6328
Case Diagnostic Tool

Trend Micro Case Diagnostic Tool (CDT) collects necessary debugging information from a customer’s product whenever problems occur. It automatically turns the product's debug status on and off and collects necessary files according to problem categories. Trend Micro uses this information to troubleshoot problems related to the product.

Run the tool on all platforms that Worry-Free Business Security supports. To obtain this tool and relevant documentation, visit http://www.trendmicro.com/download/product.asp?productid=25.

Speeding Up Your Support Call

When you contact Trend Micro, to speed up your problem resolution, ensure that you have the following details available:

- Microsoft Windows and Service Pack versions
- Network type
- Computer brand, model, and any additional hardware connected to your computer
- Amount of memory and free hard disk space on your computer
- Detailed description of the install environment
- Exact text of any error message given
- Steps to reproduce the problem

Contact Information

In the United States, you can reach the Trend Micro representatives through phone, fax, or email:
Sending Suspicious Files to Trend Micro

If you think you have an infected file but the scan engine does not detect it or cannot clean it, Trend Micro encourages you to send in the suspicious file.

You can also send Trend Micro the URL of any website you suspect of being a phish site, or other so-called "disease vector" (the intentional source of Internet threats such as spyware and viruses).

• Send an email to virusresponse@trendmicro.com, and specify "Phish or Disease Vector" as the Subject.
• Use the Trend Micro Anti-Threat Toolkit:
  

Security Information Center

Comprehensive security information is available at the Trend Micro website:

• List of viruses and malicious mobile code currently "in the wild," or active
• Computer virus hoaxes
• Internet threat advisories
• Virus weekly report
• Threat Encyclopedia, which includes a comprehensive list of names and symptoms for known viruses and malicious mobile code
TrendLabs

TrendLabs<sup>SM</sup> is the global antivirus research and support center of Trend Micro. Located on three continents, TrendLabs has a staff of more than 250 researchers and engineers who operate around the clock to provide you, and every Trend Micro customer, with service and support.

You can rely on the following post-sales service:

- Regular virus pattern updates for all known "zoo" and "in-the-wild" computer viruses and malicious codes
- Emergency virus outbreak support
- Email access to antivirus engineers
- Knowledge Base, the Trend Micro online database of technical support issues

TrendLabs has achieved ISO 9002 quality assurance certification.

Documentation Feedback

Trend Micro always seeks to improve its documentation. If you have questions, comments, or suggestions about this or any Trend Micro document, please go to the following site:
