TREND MICRO™

TippingPoint™ Threat Protection System (TPS)

Command Line Interface Reference

Privacy and Personal Data Collection Disclosure

Certain features available in Trend Micro products collect and send feedback regarding product usage and detection information to Trend Micro. Some of this data is considered personal in certain jurisdictions and under certain regulations. If you do not want Trend Micro to collect personal data, you must ensure that you disable the related features.

The following link outlines the types of data that the Security Management System collects and provides detailed instructions on how to disable the specific features that feedback the information.

https://success.trendmicro.com/data-collection-disclosure

Data collected by Trend Micro is subject to the conditions stated in the Trend Micro Privacy Policy:

https://www.trendmicro.com/en_us/about/legal/privacy-policy-product.html

Publication: November 2019

Command Line Interface

In addition to the Local System Manager (LSM) and the centralized management capability of the Security Management System (SMS), you can use the Command-line Interface (CLI) to configure and manage your device.

When you initially install the device and run the Setup Wizard, you create a superuser account that you will use to access the device through the LSM or the CLI. By default, SSH and HTTPS are enabled on the device for the management port IP address. You can access the CLI directly through the system console or remotely through SSH. Non-secure connections, such as Telnet, are not permitted.

Note

When there has been no CLI activity for 15 minutes, connection to the device times out.

Your access to the CLI is determined by your group membership and roles and capabilities. To configure granular levels of access, you can use the `aaa` (Authentication and Authorization and Auditing) context to modify users, groups, roles, and their capabilities.

SSH configuration

To configure cryptographic parameters for an SSH remote syslog server or client that is not a TippingPoint device, such as a Linux server, refer to the applicable online documentation.

For TippingPoint devices, you can enable and disable ciphers using a `debug` command in conjunction with TippingPoint support. Contact support for information on whether other cryptographic parameters are configurable.

To configure the "Remote System Log" contact to use SSH, use the following command:

```
ips{}edit
ips{running}notifycontacts
ips{running-notifycontacts}contact "Remote System Log"
```

To identify which syslog server to send the logs to, use the following command:

```
ips{running-notifycontacts-Remote System Log}server SERVER PORT
```

To identify the user of the remote syslog server, use the following command:

```
ips{running-notifycontacts-Remote System Log}ssh-user-name SERVER PORT USER
```

Consult the applicable online documentation for information on generating a key pair. To import the public key for the remote syslog server, use the following command:

```
ips{}edit
ips{running}notifycontacts
ips{running-notifycontacts}contact "Remote System Log"
ips{running-notifycontacts-Remote System Log}ssh-host-key SERVER PORT PUBLICKEY
```

To import the private key for the remote syslog server, use the following command:

```
ips{running-notifycontacts-Remote System Log}ssh-user-key SERVER PORT
Please enter the user private key (including BEGIN PRIVATE KEY
and END PRIVATE KEY lines):
```

Administrators cannot specify whether users must use either password or key-based authentication. However, key-based authorization is prioritized over password authentication (on a per-user basis) for users that have the SSH public key set.

Note

After the maximum number of authentication attempts you have configured (the range is 1–10) is reached, a lockout condition results.

To upload a user public key:

```
ips{}edit
ips{running}aaa
ips{running-aaa}user USER
ips{running-aaa-user-USER}ssh-public-key SSH_PUBLIC_KEY
ips{running-aaa-user-USER}commit
```

To delete a user public key:

```
ips{}edit
ips{running}aaa
ips{running-aaa}user USER
ips{running-aaa-user-USER}delete ssh-public-key
ips{running-aaa-user-USER}commit
```

To enable SSH for remote syslog, use the following command:

```
ips{running-notifycontacts-Remote System Log}use-ssh SERVER PORT enable
```

To enable the device to send logs to the remote syslog server, use the following commands:

```
ips{running-log} log system "Remote System Log" notice
ips{running-log} log audit "Remote System Log" ALL
```

Learn more about enabling SSH.

CLI syntax

The CLI uses the following syntax:

Syntax Convention	Explanation
UPPERCASE	Uppercase represents a user-supplied value.
(x)	Parentheses indicate a required argument.
[x]	Brackets indicate an optional argument.
|	A vertical bar indicates a logical OR among required and optional arguments.

Examples

The question mark displays help information:

```
ips{}traceroute ?
```

In the example below, required arguments for the `traceroute` command must either use an IP address or the hostname. An optional argument can be “from” a source IP address:

```
ips{}traceroute 198.162.0.1 from 198.162.0.2
```

Shortcut navigation keys

The CLI has the ability to store typed commands in a circular memory. Typed commands can be recalled with the `UP` and `DOWN` arrow keys.

You can use the TAB key to complete partial commands. If the partial command is ambiguous, pressing the TAB key twice gives a list of possible commands.

SHORTCUT	DESCRIPTION
ENTER	Runs the command.
TAB	Completes a partial command.
?	Question mark at the root prompt or after a command (separated by space) lists the next valid sub-commands or command arguments. Question mark can also be used after sub-commands for more information. A question mark immediately following a character(s) (no space) will list commands beginning with those characters.
!	Exclamation mark before a command allows you to execute the command from any feature context or sub-level. Example: `ips{running-gen}!ping 203.0.113.0`
UP ARROW	Shows the previous command.
DOWN ARROW	Shows the next command.
Ctrl + P	Shows the previous command.
Ctrl + N	Shows the next command.
Ctrl + L	Clears the screen, does not clear history.
Ctrl + A	Returns to the start of the command you are typing.
Ctrl + E	Goes to the end of the command you are typing.
Ctrl + U	Cuts the whole line to a special clipboard.
Ctrl + K	Cuts everything after the cursor to a special clipboard.
Ctrl + Y	Pastes from the special clipboard used by Ctrl + U and Ctrl + K.

Hierarchical context

Prompts are displayed based in a hierarchical context. The following table shows the root, edit, and log configuration modes.

PROMPT	DESCRIPTION
`ips{}`	Displays the top-level root mode. This context is displayed when you first log in to the CLI.
`ips{}edit`	Enters the edit configuration mode.
`ips{running}`	Displays the configuration mode by changing the prompt to running. This indicates you will be making changes to the running configuration.
`ips{running}display`	Views the current configuration and any changes.
`ips{running}commit`	Commits changes to the running configuration.
`ips{}log-configure`	Enters the log-configure context to access the log configuration mode.

PROMPT	DESCRIPTION
`ips{log-configure}`	Displays the log configuration mode.
`ips{log-configure}help`	Displays list of valid commands and syntax usage .
`ips{running}exit`	Leaves the current configuration mode.
`ips{running}!`	Leaves the configuration mode from any context and returns to the top-level root mode.

Help

The `help` command provides a list of commands within the current context and the command line usage. You can run issue the `help` command with or without an argument.

COMMAND	DESCRIPTION
`help` or `?`	Displays a list of all commands. (The question mark at any context level generates a list of available commands within the context, along with a brief description).
`help` *`commandname`*	Displays syntax for a command.
`commandname?`	Displays the options for a command. For example, `ping ?`.
`string?`	Shows the commands or keywords that match the string. For example, `s?`.

Command modes

The TPS uses a hierarchical menu structure. Within this structure, commands are grouped by functional area within one of three command modes:

COMMAND MODE	DESCRIPTION/EXAMPLE
Root	When you first log in to the device, you enter the top of the hierarchy, the root mode. `ips{}`
Edit	Enters the edit mode. `ips{running}`
Log Configuration	Enters the log configuration mode. `ips{log-configure}`

A *context* is an environment in which you can configure a set of parameters for a feature or named object. A context can be the name of an instance of an object set by the administrator, or can be the feature itself. The current context is indicated in the command prompt, as shown in the examples above.

Your user role determines whether you have access to all contexts or only specific contexts. Authorization is controlled by granting users access through the authentication context (`aaa`).

The `help` and `display` commands are useful in becoming familiar with the context options. The question mark (`?`) lists the next valid entry and help for this entry.

If the device is managed by SMS, you will have read-only access to the system resources. To determine if an SMS controls the device, or to change the control, see the `sms` command.

Root command mode

When you initially enter your device, either through the console or SSH, you enter at the root command mode. The system displays the `ips{}` prompt as a default. The commands available at this level manage and monitor system operations for the various subsystems.

From the root command mode you can access the configuration mode and the available operational commands that apply to the unit as a whole.

To view the commands available at the root level, type:

```
ips{}help
```

To change the default `ips {` command prompt, use the `host name` command in the `interface mgmt` context of the edit mode. For example:

```
ips{}edit
ips{running}interface mgmt
ips{running-mgmt}help host
```

This displays valid entries for configuring management port host settings.

To display valid entries for the host command, type:

```
ips{running-mgmt}host ?
```

To change the hostname, type:

```
ips{running-mgmt}host name <yourhostname>
```

Note

A valid hostname consists only of alpha-numeric characters and hyphens, and cannot exceed 63 characters or have a hyphen at the beginning or end.

For a list of root commands and their usage see *Root commands*.

Edit configuration mode

The configuration mode enables administrators with the appropriate credentials to write configuration changes to the active (running) configuration. To edit the device configuration, you must either be associated with the Superuser role or the Administrator role.

This mode has different context levels that provide access to a specific set of configuration commands. As you move through the context menus the command prompt displays the current context. Remember that you can issue the `help` command to display available commands for that context or type `display` to view the current configuration for that context.

Enter and exit the edit mode

To enter the edit configuration mode, use the `edit` command.

```
ips{}edit
ips{running}
```

The CLI prompt indicates that you are in the edit mode and you can then make configuration changes. Configuration options, and sub contexts are available for use until you exit this mode.

To exit the current context, use the `exit` command.

```
ips{running}exit
```

To exit the edit configuration mode from the top-level `ips{running}` prompt, use the `exit` command.

```
ips{running}exit
```

To exit the edit configuration mode from any context, use the `!` command.

```
ips{running}!
```

When you exit the edit configuration mode, the following warning is displayed: "`WARNING: Modifications will be lost. Are you sure to exit (y/n)? [n]`"

`y` discards any uncommitted changes you made to the configuration file. `n` keeps you in the edit configuration mode.

View and commit configuration changes

The `display` command is a helpful utility to view the current running configuration and to review your configuration changes before you save them.

```
ips{running} display
```

You must use the `commit` command to save your changes to the running configuration.

Container and object statements

The command hierarchy has two types of statements. The container statement, which contain objects, and the object statement, which are actual commands with options.

For example:

- Container statement in edit mode:

```
ips{running}log
```

`ips{running-log}?` (The question mark will list all the available entries.)

- Object statement:

```
ips{running}
```

`application-visibility enable|disable` (Help will display the command options.)

Edit mode workflow

A brief overview of what you can do within the edit configuration mode:

- Issue a command that configures a setting in the *candidate configuration* setting. The candidate configuration allows you to make configuration changes without causing changes to the active configuration until you can review your changes and issue the `commit` command.
- Enter into a container context to access additional configuration settings.
- Run the `display` command to see your candidate configuration settings for that particular context. Any modifications you made will also be visible.
- Run the `commit` command to save any changes from your candidate configuration to the running configuration.
- Run the `exit` command to leave the current context. If you are in the top-level root **`ips{}`** context, this command leaves the configuration mode.
- Run the `!` command to leave the configuration mode from the current context.

Configuration file versions

When troubleshooting or needing to rollback a configuration, the current configuration setup can be viewed. Reviewing network configuration files should be a necessary step to becoming knowledgeable about your current system setup. When the device is initially configured, make sure the settings are saved to the *persistent* configuration with the `ips{}save-config` command. It is also advisable to create a snapshot using the following command:

```
ips{}snapshot create orig_conf
```

Snapshots capture the configuration of a device, which can then be delivered to technical support for troubleshooting. Users can also use snapshots to save and re-apply configurations. Snapshots include the currently installed OS version, and cannot be restored on a device that is not running the same version of the OS. If a snapshot restore needs to be completed, use the following command:

```
ips{}snapshot restore orig_conf
```

A warning message is displayed, followed by an automatic reboot when snapshot restore is completed.

The CLI uses the *deferred-commit* model. In this capacity, the architecture maintains a set of configuration files to ensure that a working configuration is persistently maintained. This configuration set includes the following configuration files.

- *Running* configuration — This version is currently executing on the system. Any changes that administrators make from the edit mode (*except for IPS features, action sets, application groups, and notification contacts*) will take effect once they have been committed, by issuing the `commit` command. If changes are not committed, all modifications are discarded on `exit` from the running context. If multiple administrators are on the system, the version that was last committed is used as the current running configuration and is visible to other administrators, once they have exited the `edit` mode. A warning prompt is displayed if the committed changes would overwrite configuration that was made by another administrator since the configuration was edited.
- *Saved (persistent)* configuration — This is the running configuration that was last committed prior to executing the `save-config` command. The device copies the saved configuration to the start configuration when the system reboots.
- *Start* configuration — This is a backup copy of the configuration file saved at the time of system startup, and is loaded at the next system bootup. The `rollback-config` command can be used to rollback to a persistent and running configuration that was the last known good configuration.

Note

Future versions of the product will support multiple named saved configuration sets.

Utilities

The `display` and `show` commands are helpful for troubleshooting and monitoring the operational status of the system. Command line usage can be found in *Root commands*.

Display

Enter `display` to see your candidate configuration settings for a context. Any modifications you make can be viewed using the `display` command. The output of the display command depends on where the command is executed. If executed at the configuration level, it displays the entire configuration of the unit. Executing the display command with a configuration name parameter, or from within a context displays the contents of that particular configuration.

Show

The `show` command is most efficient in providing critical information, such as traffic usage, router platform type, operating system revision, amount of memory, and the number of interfaces. The `show` command can also be used to evaluate logging,

troubleshooting, tracking resources, sessions, and security settings. To view all the available `show` utilities, enter the `help show` command at the root command level. All the available commands along with the correct command line usage are displayed.

Global commands

Global commands can be used in any context.

cls

Clears the terminal screen.

```
cls
```

commit

Commits your pending configuration changes to the Running configuration.

When you commit configuration changes, or when changes are committed automatically, the changes are committed to the Running configuration, and the changes are visible to all users. However, when the device reboots, the Running configuration is reset to the Startup configuration. Uncommitted changes and committed changes in the Running configuration are lost.

Tip

To copy the Running configuration to the Startup configuration without exiting the configuration mode, prepend the **`save-config`** command with an exclamation mark (!), for example **`!save-config`**. This command does not commit any pending changes to the Running configuration.

Syntax

`commit`

To commit your pending changes to the Running configuration, and then copy the Running configuration to the Startup configuration, enter the following commands:

```
ips{running}commit
```

```
ips{running}!save-config
```

Related commands

COMMAND	DESCRIPTION
save-config	Copy the Running configuration to the Startup configuration.

display

Displays the current configuration, or the candidate configuration before a commit is issued. Display options vary by context, enter the `help display` command in a context to view the available options.

Syntax

```
display
```

```
display [xml]
```

edit

The edit context modifies the configuration that identifies the security policy and interfaces that you can configure for your device.

Edit takes an instance of the running configuration file. This instance is your version. After making modifications to this candidate configuration version, you have the option of saving it to the running configuration, or discarding any changes you made. To discard, simply `exit`. To save your candidates configuration, enter the `commit` command before exiting the edit context. To see commands under the edit context, see *Edit configuration mode*.

```
ips{}

ips{}edit

ips{running}

Valid entries at this position are:

  aaa                     Configure users, roles, and remote authentication
  actionsets              Enter action sets context
  autodv                  Enter autodv context
  certificates            Enter certificates context
  debug                   Enter debug context
  delete                  Delete file or configuration item
  display                 Display file or configuration item
  dns                     Enter DNS context
  exit                    Exit edit context, see also save-config
  gen                     Timezone, ssh/https access, ip-to-hostname association
  help                    Display help information
  high-availability       Enter high-availability context
  interface               Enter interface context
  ips                     Enter IPS profile context
  log                     Enter log context
  notifycontacts          Enter notify contacts context
  ntp                     Enter NTP context
  reputation              Enter Reputation context
  security-policy-reset   Reset IPS security policy to default values
  segments                Segments context
  services                Enter services context
  sflow                   sFlow context
  snmp                    Enter SNMP context
  traffic-management      Enter traffic-management profile context
  virtual-segments        Enter virtual-segments context
  vlan-translations       Enter vlan-translations context

ips{running}commit

ips{running}exit

ips{}
```

Note

Use debug commands only when you are instructed to do so by TippingPoint product support.

help

Displays help information.

Syntax

```
help [full|COMMAND]
```

Root commands

The top level root command line mode displays the `ips{}` prompt. Commands at this level are used for managing and monitoring system operations for the various subsystems. From the root command mode, you can access the configuration mode, and the available commands that apply to the device as a whole. Enter **`help full`** or **`help COMMANDNAME`** at the command prompt to display a list of available commands or help on a specific command.

```
ips{}help
```

The default `ips{}` command prompt can be changed using the **`host name`** command in the **`interface mgmt`** context of the edit mode. For example:

```
ips{}edit
```

```
ips{running}interface mgmt
```

`ips{running-mgmt}help host` (displays valid entries for configuring management port host settings)

`ips{running-mgmt}host ?` (displays valid entries for host command)

```
ips{running-mgmt}host name yourhostname
```

Note

Use debug commands only when you are instructed to do so by TippingPoint product support.

boot

Lists software packages and rollback to a previous version.

Syntax

```
boot (list-image|rollback)
```

chpasswd

Enter this command to change the password for your local user account, or for another local user. To change the password for another user, you must be associated with the SuperUser role.

You can use this command when the device is managed by the SMS, or is unmanaged.

Syntax

`chpasswd` *user_name*

clear

Clears system stats, logs, locked users, adaptive filter configurations (AFCs), or packet traces.

Syntax

```
clear adaptive-filter [all|FILTERNUMBER]
```

```
clear connection-table (blocks|trusts)
```

```
clear log-file (audit|ipsAlert|ipsBlock|quarantine|reputationAlert|reputationBlock|
sslInspection|system)
```

```
clear np engine filter

clear np engine packet

clear np engine parse

clear np engine reputation dns

clear np engine reputation ip

clear np engine rule

clear np reassembly ip

clear np reassembly tcp

clear np rule-stats

clear np softlinx

clear np tier-stats

clear counter policy

clear rate-limit streams

clear users all [locked|ip-locked]

clear users (NAME|A.B.C.D|X:X::X:X) [locked]
```

date

Used alone to set and display the current date and time, or with arguments to configure the date in a 24-hour format. The date command shows the current time in the time zone configured on the device and the "gmt" argument shows the time in GMT (UTC).

Syntax

```
date [MMDDhhmm[[CC]YY][.ss]])

date gmt
```

delete

Deletes various items.

Syntax

```
delete

Valid entries at this position are:

delete auxdv <auxdv name>
delete corefiles
delete dv-toolkit
delete sms must-be-ip
delete traffic-file FILENAME
```

delete auxdv

Delete Aux DV.

Syntax

```
delete auxdv <auxdv name>
```

display conf

Displays information on a particular configuration file in either the `start` configuration or the `running` configuration.

Syntax
`display conf start|running` *conf-name*

Enter the **`display conf`** command and press the Tab key twice to display a list of available configuration files.

```
ips{}display conf running
aaa                 actionsets        autodv            certificates
dns                 gen               highavailability  inspection-bypass
interface           ips               log               notifycontacts
ntp                 reputation        segment1          segment2
segment3            segment4          segment5          segment6
segment7            segment8          snmp              ssl-inspection
traffic-management virtual-segments  vlan-translations debug
```

Displays SSL configuration.

```
ips{}display conf running ssl-inspection
```

display-config

Displays information on the configuration specified (either the `start` configuration or the `running` configuration).

Syntax
`display-config (start|running)`

edit

The edit context modifies the configuration that identifies the security policy and interfaces that you can configure for your device.

Edit takes an instance of the running configuration file. This instance is your version. After making modifications to this candidate configuration version, you have the option of saving it to the running configuration, or discarding any changes you made. To discard, simply `exit`. To save your candidates configuration, enter the `commit` command before exiting the edit context. To see commands under the edit context, see *Edit configuration mode*.

```
ips{}
```

```
ips{}edit
```

```
ips{running}
```

```
Valid entries at this position are:
```

```
  aaa                     Configure users, roles, and remote authentication
  actionsets              Enter action sets context
  autodv                  Enter autodv context
  certificates            Enter certificates context
  debug                   Enter debug context
  delete                  Delete file or configuration item
  display                 Display file or configuration item
  dns                     Enter DNS context
  exit                    Exit edit context, see also save-config
```

```
  gen                     Timezone, ssh/https access, ip-to-hostname association
  help                    Display help information
  high-availability       Enter high-availability context
  interface               Enter interface context
  ips                     Enter IPS profile context
  log                     Enter log context
  notifycontacts          Enter notify contacts context
  ntp                     Enter NTP context
  reputation              Enter Reputation context
  security-policy-reset   Reset IPS security policy to default values
  segments                Segments context
  services                Enter services context
  sflow                   sFlow context
  snmp                    Enter SNMP context
  traffic-management      Enter traffic-management profile context
  virtual-segments        Enter virtual-segments context
  vlan-translations       Enter vlan-translations context
```

```
ips{running}commit

ips{running}exit

ips{}
```

Note

Use debug commands only when you are instructed to do so by TippingPoint product support.

fips-mode-enable

Enables the Federal Information Processing Standard (FIPS) on a TPS device.

Before you run this command, always reset the device to factory default settings.

When you run this command, it prompts you to confirm that you want to enable FIPS mode. After you enable FIPS mode, it cannot be disabled except by resetting the device to factory defaults.

Note

Both RADIUS and TACACS+ authentication use protocols that are not FIPS-compliant. Do not enable FIPS mode if you have remote authentication configured.

After you run this command, you must reboot the device to enable FIPS mode. If FIPS mode fails, the reboot aborts and the user is sent to the system recovery prompt. In addition, the system log records a message with a `PASS` or `FAIL` status of FIPS mode. For help diagnosing the issue, contact support.

Syntax

```
fips-mode-enable
```

Use the `show fips-mode` command to verify whether FIPS mode was successfully enabled.

halt

Enter the `halt` command to shut down the TippingPoint operating system and halt the CPU while maintaining power to the device. After you run this command, the device still has power so Layer-2 Fallback (L2FB) enables traffic to pass through the device:

- For the 440T, power can be removed by unplugging the unit or by turning off the power switch on the back of the unit. To restart the 440T, wait at least 60 seconds before you re-apply power.
- For the 2200T, power can be removed by holding down the front panel power button for 5 seconds, and can be restored by pressing the power button.

Syntax

```
halt
```

high-availability

Use the **high-availability** context to manage Intrinsic Network High Availability (INHA) and Zero-Power High Availability (ZPHA).

- *INHA* determines how the device manages traffic on each segment in the event of a system failure:
  - *Layer-2 Fallback (L2FB)* – Either permits or blocks all traffic on each segment, depending on the INHA L2FB action setting for the segment. Any permitted traffic is not inspected.

    Important

    If you enable INHA L2FB, L2FB **not** persist when you reboot the device.

  - *Normal* – Permits and inspects traffic across all segments.
- *ZPHA* determines how the device routes traffic in the event of a loss of system power:
  - *Bypass* – Bypasses traffic at the port level to maintain high availability of any network segments that have ZPHA support. When ZPHA bypass is enabled, the INHA Layer-2 fallback action setting for each segment is ignored.

    Important

    If you enable ZPHA bypass, bypass persists when you reboot the device.

  - *Normal* – Routes traffic from each network segment to the Threat Suppression Engine (TSE) for inspection.

  ZPHA support varies by device:

  - On a TippingPoint TX Series device, optional bypass I/O modules provide high availability for copper and fiber segments. You can enable bypass mode on a particular slot or all slots with a bypass I/O module. When you configure a TX Series device, use the **slot** parameter to specify a particular I/O slot or the **all** parameter to specify all slots.
  - On a TippingPoint 2200T security device, ZPHA support is built-in for copper segments. An external ZPHA module is required to enable ZPHA on SFP and SFP+ segments. Bypass mode can be enabled on all segments of the device only.
  - On a TippingPoint 440T security device, ZPHA support is built-in for copper segments only. Bypass mode can be enabled on all segments of the device only. You do not need to specify the **all** parameter to enable ZPHA bypass on a TPS 440T or 2200T security device
  - On a TippingPoint Virtual Threat Protection System (vTPS) security device, ZPHA bypass mode cannot be enabled.

Syntax

Enables INHA L2FB.

```
high-availability force (fallback|normal)
```

Enables ZPHA bypass.

```
high-availability zero-power (bypass|normal) (slot|all)
```

keystore

Changes the keystore mode to enable private keys to be secured in the device keystore or the SMS. This command automatically clears the contents of the keystore. If the device is managed by the SMS, first unmanage the device, then use this command to persist private keys on the device.

Only use this command when **absolutely necessary,** such as when the device has lost contact with the SMS, or other similar troubleshooting situations. Under normal conditions, this setting should only be changed by using the SMS.

Change the keystore mode, for example, if the SMS is unreachable and you want the device to persist its own private keys. Use the **`sms-unmanage`** command to unmanage the device, and then use the **`keystore on-device`** command to change the keystore mode to the local keystore. After you change the keystore mode, use the **`save-config`** command to copy the running configuration (which includes the private keys in the Running configuration) to the Start configuration. If the private keys are not in the running configuration, for example, because you rebooted the device after you unmanaged it, use the **`private-key`** command to import the private keys manually.

Note

When the keystore mode is **sms-managed**, private keys are not persisted in the device keystore.

Syntax

```
keystore on-device|sms-managed
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}private-key	Import the private key from your web server into the local keystore on the device.
ips{running-certificates}certificate	Import the certificate from your web server into the local keystore on the device.
ips{running-sslinsp}server	Add an SSL server to the device with the same security settings as your web server, and assign the corresponding certificate and private key.

list

Displays traffic capture file list.

Syntax

```
list traffic-file
```

log-configure

Enters log configuration context.

Syntax

```
log-configure
```

logout

Logs you out of the system.

Syntax
```
logout
```

master-key

You can set the master key to a device-generated key that is unique to the device or specify your own *master key passphrase*. By default, TOS v5.0.0 and later encrypts the system keystore with a device-generated master key.

(Best Practice) To avoid keystore issues with a TOS rollback, set the master key to a passphrase that you specify. If the keystore in the rollback image is secured with a different master key than the master key that is set on the device, you can set the master key to the correct passphrase. For more information, see the *Local Security Manager User Guide*.

Before you change the master key, keep in mind the following points:

- By default, the external user disk is not encrypted. You can easily access the contents of the external user disk from a different device.
- If you choose to encrypt the external user disk, the master key encrypts and decrypts the external user disk.
    - If you change the master key while the external user disk is encrypted, all traffic logs, snapshots, ThreatDV URL Reputation Feed, User-defined URL Entries database, and packet capture data are erased from the external user disk.
    - To access the contents of an encrypted external user disk from a different device, for example to restore a snapshot, the same master key must also be set on the device.

Note

For security purposes, these commands require you to re-enter your password. If you incorrectly enter your password too many times, you are temporarily locked out for two minutes. To verify your account lock status, enter the `show user locked` command.

Enter an option to set the master key:

- `passphrase` – This option allows you to specify a passphrase for the master key.

  The passphrase must meet the following complexity requirements:
    - Must be between 9 and 32 characters in length
    - Combination of uppercase and lowercase alpha and numbers
    - Must contain at least one special character (!@#$%)
- `device-generated-key` – This option generates a passphrase for the master key.

Syntax
```
master-key (set [device-generated-key|passphrase]|reset-keystore)
```

ping

Tests connectivity with ICMP traffic. The mgmt option uses the management interface.

Syntax
```
ping (A.B.C.D|HOSTNAME) [count INT] [maxhop INT] [from A.B.C.D] [datasize INT]
```

```
ping (A.B.C.D|HOSTNAME) [count (1-900000)] [maxhop (1-800)] [from A.B.C.D] [datasize
(64-65468)]

ping6 (X:X::X:X|HOSTNAME) [count INT] [maxhop INT] [from X:X::X:X] [datasize INT]

ping6 (X:X::X:X|HOSTNAME) [count (1-900000)] [maxhop (1-800)] [from X:X::X:X] [datasize
(64-65468)]
```

ping6

Tests connectivity with ICMPv6 traffic.

Syntax

```
ping6 (X:X::X:X|HOSTNAME) [count (1-900000)] [maxhop (1-800)] [from X:X::X:X] [datasize
(64-65468)]
```

quarantine

Manages the quarantined traffic and IP address. Enables you to see and clear a quarantine list, and add or remove quarantined IP addresses.

Syntax

```
quarantine add <IP> <Actionset>

quarantine remove <IP>

quarantine empty

quarantine list
```

Related commands

show quarantine-list

reboot

Reboots the system. On a TPS device, this command puts the device in Intrinsic HA Layer-2 Fallback mode until the TOS completes its boot sequence. On a vTPS device, traffic flow is interrupted until the boot sequence completes because, unlike a TPS device, the network ports on the vTPS device are virtual.

Specify a full system restart with the `full` option. On a TPS device, this command temporarily removes power from the device which puts the device in ZPHA Bypass mode until the TOS completes its boot sequence. On a vTPS device, traffic flow is interrupted until the boot sequence completes because, unlike the TPS device, the network ports on the vTPS device are virtual.

Syntax

```
reboot [full]
```

reports

Configure data collection for on-box reports.

Syntax

```
reports (reset|enable|disable) [all|cpu|disk|fan|memory|network|rate-limiter|temperature|
traffic-profile|vpn]
```

```
Valid entries:
reset             Delete report data
```

```
enable              Start data collection for reports
disable             Stop data collection for reports
```

Related commands

show reports

resize

Resizes the terminal.

Syntax
```
resize
```

save-config

Copies the Running configuration to the Startup configuration. When you reboot the device, the Startup configuration is applied to the device.

Note

To run this command, you must be at the top-level root **`ips{}`** mode. To run this command without exiting the current context, prepend an exclamation mark (!) to the command. When run from a context, this command does not commit your pending changes to the Running configuration.

Syntax

```
save-config
```

Related commands

COMMAND	DESCRIPTION
commit	Commit your pending changes to the Running configuration.

service-access

Enables or disables service access.

Syntax
```
service-access (enable|disable)
```

set

Configures an item.

Syntax
```
set cli filtering rule (auto-comment|no-auto-comment|(last-auto-comment-value INT))
```

setup

Runs the setup wizard.

Syntax
```
setup
```

show

View current system configuration, status, and statistics.

COMMAND	DESCRIPTION
show aaa	Show AAA information.
show auxdv	Show the AuxDV package.
show date	Show the current router date and time.
show dns	Show Domain Name Service.
show filter	Show filter information.
show health	Show health information.
show high-availability	Show high-availability status.
show interface	Show network interface.
show key	Show local server SSH key information.
show license	Show the license number and status.
show log-file	Show the log files.
show log-file boot	Show the boot file.
show mfg-info	Show manufacturing information.
show np engine	Show net processor statistics.
show np general statistics	Show general network processor information.
show np mcfilt-rule-stats	Show microfilter rules, number of flows, successful matches.
show np protocol-mix	Show network processor protocol-level statistics.
show np reassembly	Show network processor reassembly statistics.
show np rule-stats	Show network processor rules, number of flows, successful matches.
show np softlinx	Show network processor softlinx statistics.
show np tier-stats	Show network processor throughput and utilization for each tier.
show ntp	Show the current NTP settings.
show quarantine-list	Show quarantine list information.
show reports	Show status of data collection for reports.
show service	Show network service information.
show sflow	Show sFlow sampling configuration information.
show sms	Show status of SMS control.
show snmp	Show SNMP information.
show stacking	Show stacking information.
show system connections	Show active socket information.
show system processes	Show system processes.

COMMAND	DESCRIPTION
show system queue-stats	Show internal queue stats.
show system statistics	Show system-wide protocol-related statistics.
show system usage	Show system usage.
show system virtual-memory	Show system virtual memory.
show system xms memory	Show xms memory usage.
show terminal	Show terminal settings.
show traffic-file	Show network traffic from file.
show tse	Show threat suppression engine information.
show user-disk	Show user-disk statistics.
show users	Show users information.
show version	Show device version information.
show virtual segments	Show virtual segment configuration.

show aaa

Syntax

```
show aaa capabilities USER
```

show auxdv

Displays AuxDV package.

Syntax

```
show auxdv
```

show date

Shows the GMT time or the local time and time zone for the device.

Syntax

```
show date [gmt]
```

show dns

Syntax

```
show dns
```

show filter

Displays the filters.

Syntax

```
show filter [XFILTERNUMBER | UDVFILTERNUMBER]
```

Note

You can locate the application filter numbers from the LSM page, **Reports > Top Filter Matches**.

show health

Shows health information.

Syntax

```
show health
```

show high-availability

Syntax

```
show high-availability
```

Related Commands

```
high-availability force (fallback|normal)
```

```
high-availability zero-power (slot <number>|all) (bypass-ips|normal)
```

show inspection-bypass

Syntax

```
show inspection-bypass
```

show interface

Syntax

```
show interface [INTERFACE [statistics [update INT]]]
```

show key

Shows local server SSH key.

Syntax

```
show key
```

show license

Syntax

```
show license
```

show log-file

The following log files are available:

- system
- audit
- boot
- ipsAlert

- ipsBlock
- reputationAlert
- reputationBlock
- quarantine

show log-file boot

Sytnax

```
show log-file boot [tail [COUNT]] [more]

show log-file boot [search [<options>]{0,2} PATTERN] [count COUNT] [more]
```

If using the `more` option, the colon will display in the output, to indicate more information is available. Press the Enter key for the scroll to continue, or enter a `q` to exit and return to the `ips{}` prompt.

show log-file FILE_NAME

Syntax

```
show log-file audit    [raw|tab|csv|rawcsv] [addUUID]
     [ASC|DESC|(tail [COUNT])] [seqnum] [more]

show log-file ipsAlert    [raw|tab|csv|rawcsv] [addUUID]
     [ASC|DESC|(tail [COUNT])] [seqnum] [more]

show log-file ipsBlock    [raw|tab|csv|rawcsv] [addUUID]
     [ASC|DESC|(tail [COUNT])] [seqnum] [more]

show log-file quarantine    [raw|tab|csv|rawcsv] [addUUID]

show log-file boot [search    [(options)]{0,2} PATTERN] [count COUNT] [more]
```

show log-file FILE_NAME stat

Shows the beginning sequence number, ending sequence number, and number of messages for the given log file.

Syntax

```
show log-file FILE_NAME stat
```

show log-file summary

Syntax

```
show log-file summary [verbose]
```

show mfg-info

Shows manufacturing information.

Syntax
```
show mfg-info
```

show np engine

Shows network processor information.

Syntax

```
show np    engine(filter|packet|parse|reputation(ip|dns)|rule)
     filter - Show filter-level    statistics
     packet - Show packet-layer    statistics
     parse - Show packet    parsing statistics
     reputation - Show    reputation statistics on either IP or DNS
     rule - Show rule    statistics
```

show np general statistics

Shows general network processor information.

Syntax
```
show np general statistics
```

show np mcfilt-rule-stats

Shows microfilter rules, number of flows, and successful matches.

Syntax
```
show np mcfilt-rule-stats
```

show np protocol-mix

Syntax
```
show np protocol-mix
```

show np reassembly

Syntax
```
show np reassembly (ip|tcp)
```

show np rule-stats

Syntax
```
show np rule-stats
```

show np softlinx

Syntax
```
show np softlinx
```

show np tier-stats

Displays statistics for monitoring activity since the last reboot of the device. Reboot the device to reset these counters.

Syntax

```
show np tier-stats
```

show ntp

Syntax
```
show ntp
```

show quarantine-list

Syntax
```
show quarantine-list
```

show reports

Shows the status of the data collection for reports.

Syntax
```
show reports
```

show service

Shows the state of all the services.

Syntax
```
show service
```

show sflow

Syntax
```
show sflow
```

show slot

Displays slot configuration, including the module type currently in the slot. Changes to the slot configuration are not reflected in the output of this command until after you reboot the device.

Syntax
```
show slot
```

show sms

Sytnax
```
show sms
```

show snmp

Syntax
```
show snmp
```

show ssl-inspection congestion

Shows SSL inspection information, including the average number of SSL connections per second, the number of current SSL connections (and the device limit), and whether SSL sessions that exceed the device limit are not inspected or blocked. By default, SSL sessions that exceed the device limit are not inspected.

Syntax

```
show ssl-inspection congestion
```

show stacking

Enter this command to show stacking status information.

Syntax

```
show stacking
```

Reference

PARAMETER	INFORMATION
`Stacking enabled`	Indicates whether stacking is enabled on the device.
`Stacking active`	Indicates whether stacking is currently functioning.
`Stack member state`	Indicates the current working state of this device on the stack.
`Stack master`	Indicates whether this device manages the state of the stack.
`Number of devices configured in stack`	Indicates the number of TippingPoint TPS security devices that are connected together through the stacking bus.
`Number of devices required in stack`	Indicates the minimum number of devices that must be available to the stack for normal operation. If the number of normal devices falls below this threshold, the stack goes into Intrinsic HA L2FB.
`Advertised state`	Indicates the state that the device advertises to the stack master.

show system connections

Lists all of the processes on the device that are open for remote connections and which connections are currently in progress.

For the format of the output, refer to netstat documentation.

Syntax

```
show system connections [ipv4|ipv6|sctp|unix]
```

show system processes

Syntax

```
show system processes [LEVEL]
brief       Brief process information
detail      Detailed processinformation
extensive   Extensive processinformation
summary     Active process information
```

show system queue-stats

Show internal queue statistics.

Syntax

```
show system queue-stats [fast-path]
```

show system statistics

Syntax

```
show system statistics [fast-path] [non-zero]
```

show system usage

Shows the overall system usage. You can run once, or display an updated version every INT seconds. Ctrl-C will exit a re-occurring update.

Syntax

```
show system usage [update INT]
```

show system virtual-memory

Shows the system's kernel memory usage in a table with the following column headings:

- name
- active_objs
- num_objs
- objsize
- objperslab
- pagesperslab
- tunables
- limit
- batchcount
- sharedfactor
- slabdata
- active_slabs
- num_slabs
- sharedavail

Syntax

```
show system virtual-memory
```

show system xms memory

Shows xms memory statistics.

Syntax

```
show system xms memory (all| SERVICE)
```

show terminal

Shows terminal type information.

Syntax

```
show terminal
```

show traffic-file

Syntax

```
show traffic-file FILENAME [verbose INT] [proto PROTO] [without PROTO] [pcap FILTER]
[pager]
```

Options

```
traffic-file Show network traffic from file
   FILENAME   Capture file name
   verbose    Configure verbosity level
   INT        Verbosity level (0: minimum verbosity)
   proto      Configure captured packets protocol
   PROTO      Protocol name (default: all)
   without    Configure excluded packets protocol
   PROTO      Protocol name (default: all)
   pcap       Configure pcap-syntax filter
   FILTER     Pcap filter string (e.g. "src port 22")
   pager      Show all messages
```

show tse

Shows threat suppression engine information.

Syntax

```
show tse (adaptive-filters|connection-table(blocks|trusts)|rate-limit|ssl-inspection)
```

show tse connection-table

Syntax

```
show tse connection-table TYPE
```

show user-disk

Syntax

```
show user-disk
```

show users

Syntax

```
show users [locked|ip-locked]
```

show version

Syntax

```
show version
```

show virtual segments

Shows virtual segment configuration.

Syntax
```
show virtual segments [summary]
```

sms

Allows you to configure SMS settings and release SMS.

Syntax
```
sms must-be-ip (A.B.C.D|A.B.C.D/M)

sms unmanage
```

Related commands

show sms

snapshot create

Allows you to manage system snapshots.

Syntax

```
snapshot create NAME[(reputation|manual|network)]

Default is do not include the following:
     manual        Include manually defined reputation entries in snapshot
     network       Include Management port configuration in snapshot
     reputation    Include reputation package in snapshot
     nonet         Does not restore management port configuration if present
                in snapshot
```

snapshot list

Syntax
```
snapshot list
```

snapshot remove

Syntax
```
snapshot remove
```

snapshot restore

A *snapshot* enables you to restore a device to a previously known working state. Restore a snapshot to the same device or to a different device. You can also export a snapshot and send it to TippingPoint Technical Support for assistance with troubleshooting or debugging the device. All snapshots are stored on the external user disk (CFast or SSD).

Make sure the device where you want to restore the snapshot meets the following requirements:

- The TOS version on the device is the same as the TOS version that was installed when the snapshot was taken.
- The device is the same model as the device where the snapshot was taken. For example, you can restore a snapshot from a 2200T to a 2200T.

When restoring a snapshot, keep in mind:

- The contents of the system keystore are not included in the snapshot. When you restore a snapshot to a different device, you should plan to also import any private key information from the device where the snapshot was taken.
- Never delete certificates that are used in snapshots that have, or have had, SSL configurations. Although the system will still complete its reboot sequence after restoring a snapshot that has had its SSL configuration (and corresponding device certificate) removed, the restored SSL configuration will not be functional until you update the private key for each certificate or replace the entire SSL configuration.
- When you want to restore a snapshot to a different device, and URL Reputation Filtering is enabled, a full synchronization of the Reputation database is required after you restore the snapshot. The snapshot does not include the ThreatDV URL Reputation Feed and User-defined URL Entries database. For more information, see the *SMS User Guide*.
- The snapshot includes the license package. The license package provides license information for each of your TippingPoint devices. If the license package that was included in the snapshot is outdated, restore the snapshot and then download and install an updated license package from the TMC.
- If an external ZPHA was configured on the original device, be sure to add an external ZPHA to the target device or update the device configuration to remove ZPHA.

Syntax

```
snapshot restore NAME
```

tcpdump

Allows you to capture network traffic to the terminal or a file. You can specify a maximum packet count or a maximum capture file size. If you record the capture to a file you must specify a maximum packet count or maximum capture file size. Maxsize is the maximum size of the capture file in millions of bytes, which is limited by the currently available disk allocation.

Syntax

```
tcpdump INTERFACE [record FILENAME [maxsizebytes 1-10000000]]
[packetcount 1-10000000] [verbose 0-990000]
[proto (icmp|igmp|tcp|udp|esp|ah|pim|snp|vrrp|stp|isis|sctp)] [without
(icmp|igmp|tcp|udp|esp|ah|pim|snp|vrrp|stp|isis|sctp)] [pcap FILTER]
[cponly][pager] [background]

tcpdump stop
```

tech-support-report

Collects diagnostic information into a Tech Support Report (TSR) that TippingPoint Support can use to debug and troubleshoot system issues. It includes diagnostic commands, log files, the core file directory, and optionally a full system snapshot. The Tech Support Report snapshot captures the system's current running configuration.

If you include a snapshot with your Tech Support Report, the snapshot does not contain the following sensitive information:

- User names and passwords
- LDAP and remote server passwords
- SNMPv3 passphrase
- HA passphrase
- VPN IPsec keys

- Keystore

Only one report can exist on the device. When you create a new report, the previous report is replaced.

After you create a TSR, use the Local Security Manager (**Tools > Tech Support Report**) to export and view the TSR.

You should execute this command only when requested to do so by TippingPoint Support personnel.

It can take several minutes to execute this command. By default, this command is allowed to run as long as necessary to generate the TSR. Use the `max-runtime` option, if necessary, to set a maximum threshold for the amount of time, in seconds, that the command is allowed to run before interrupting the report generation.

Syntax

```
tech-support-report include-traffic-logs|exclude-traffic-logs
include-snapshot|exclude-snapshot include-corefiles|exclude-corefiles
[max-runtime INSECONDS]
```

traceroute

Traceroute shows you the path a packet of information takes from your computer to your designation. It lists all the routers it passes through until it reaches its destination, or fails. Traceroute tells you how long router to router hops take.

Syntax

```
traceroute (A.B.C.D|HOSTNAME) [from A.B.C.D]
```

```
(traceroute|traceroute6) X:X::X:X [from X:X::X:X]
```

traceroute6

Trace IPv6 network routes.

Syntax

```
ips{}traceroute6 (A.B.C.D|HOSTNAME) [from A.B.C.D]
```

user-disk

Mounts, unmounts, and formats the external user disk (CFast or SSD).

After you mount the user disk, the device can automatically mount the disk when you reboot the device.

You can also enable encryption on the external user disk to secure its contents with the system master key. The external user disk stores all traffic logs, snapshots, and packet capture data. By default, the external user disk is not encrypted.

Before you secure the external user disk, keep in mind the following points:

- When you change the encryption status of the external user disk, the device automatically formats the disk and all traffic logs, snapshots, and packet capture data are erased. On large, external CFast disks (32 GB or more), it can take 40 seconds or more to complete disk format and encryption operations.
- The system master key encrypts and decrypts the external user disk. To access the contents of an encrypted external user disk from a different device, for example to restore a snapshot, the same master key must also be set on the device.

Syntax

```
user-disk (encryption (enable|disable) | format | mount | unmount)
```

- *Unmount* – Unmount the external user disk.

- *Mount* – Mount the external disk and enable the device to automatically mount the disk on boot.
- *Format* – Format the external user disk.
- *Encryption Enable* – Enable encryption on the external user disk.

Related commands

show user-disk

master-key

Log configure commands

Enter the `log-configure` command to access the log configure context. Enter a question mark (?) at the `ips{log-configure}` prompt to display a list of valid command entries. Then enter `Help` command name to display help for a specific command.

display

Displays log configuration settings. In contrast to the `show` command, which shows the status of a configuration, the `display` command shows what you have configured. For example, if you enable high-availability on one device but not the other, the `display` command will show that you have high-availability configured and the `show` command will show that high-availability is not in effect.

Syntax

```
display [log-sessions] [xml|verbose]
```

email

Allows you to set logging email daemon parameters.

Syntax

```
email set sleepSeconds SLEEPSEC
email set maxRequeue MAXREQUEUE
email delete (sleepSeconds|maxRequeue)
```

log-file-size

Sets log file allocation as a percentage of the total 100 percent allowed for all log files. When audit log data reaches 75% of its allocated space, an alert is generated (not configurable).

```
# LOG FILE ALLOCATION SETTINGS
# INTERNAL DISK
log-file-size system          50%
log-file-size audit           50%
#                            ----
#                     Total 100%
```

Syntax

```
log-file-size FILE_NAME USAGE[%]
log-file-size
(audit|ipsAlert|ipsBlock|quarantine|reputationAlert|
reputationBlock|sslInspection|system) USAGE[%]
system and audit log files are kept on the internal disk
```

```
ipsAlert, ipsBlock, quarantine, reputationAlert,
reputationBlock, and sslInspection log files are kept on the external
or ramdisk drive
```

log-storage

Sets local log file allocation of external user disk (CFast or SSD) space. Usage value can range from 50 to 99 percent. By default, 3.5 GB of the disk is a reserve for non-logging storage, which includes the Reputation databases. Although this space can be reduced or increased when rare circumstances require it, reducing the reserved space can interfere with URL filtering.

Syntax

```
log-storage external USAGE[%]

log-storage ramdisk USAGE[%]

log-storage externalReserve RESERVESIZE [MB]
```

log-test

Sends a test message to the logging system(s).

Syntax

```
log-test (all|audit|quarantine|logID LOGID) [emergency [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [alert [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [critical [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [error [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [warning [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [notice [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [info [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [debug [MESSAGE]]
log-test (all|audit|quarantine|logID LOGID) [msg MESSAGE]

Valid entries:
all         All log systems
audit       Audit system
quarantine  Quarantine system
logID       LogID system
LOGID       Log-session ID to test
SEVERITY    Set Severity level for log message (default: INFO)
Possible values for SEVERITY are:
emergency   EMERG level
alert       ALERT level
critical    CRIT level
error       ERR level
warning     WARNING level
notice      NOTICE level
info        INFO level (default)
debug       DEBUG level
msg         Override default message
MESSAGE     Message to send to logging system
```

rotate

Sets log rotation parameters.

Syntax

```
rotate (set|delete) defaultCheckRecords (100-65535)
rotate (set|delete) defaultFiles (2-20)
rotate (set|delete) maxFileSize (10-500MB)
rotate (set|delete) rotateMsgSeverity SEVERITY
rotate (set|delete) sleepSeconds (1-65535)
rotate (set|delete) audit [Files (2-20)] [Records (100-65535)]
rotate (set|delete) ipsAlert [Files (2-20)] [Records (100-65535)]
rotate (set|delete) ipsBlock [Files (2-20)] [Records (100-65535)]
rotate (set|delete) quarantine [Files (2-20)] [Records (100-65535)]
rotate (set|delete) reputationAlert [Files (2-20)] [Records (100-65535)]
rotate (set|delete) reputationBlock [Files (2-20)] [Records (100-65535)]
rotate (set|delete) system [Files (2-20)] [Records (100-65535)]
rotate (set|delete) visibility [Files (2-20)] [Records (100-65535)]

sleepSeconds          Logrotation sleep time between checks
SLEEPSEC              Number of seconds logrotation waits between checks
defaultFiles          Default number of logrotation files
NUMFILES              Number of logrotation files (2 - 20)
defaultCheckRecords   Default number of records between log daemon size checks
NUMRECORDS            Number of records between log daemon size checks
                      (100 - 65535)
maxFileSize           Max size a 'rotated' log file
MAXFILESIZE           Max log rotation file size in MB (10 - 500)
MB                    Megabytes
FILE_NAME             Local log file name
Files                 Number of logrotation files
Records               Number of records between log daemon size checks
delete                Delete the logrotation parameter
```

Edit running configuration commands

Enter the `edit` command to access the configuration mode. In edit mode, you can perform numerous configurations, such as policies and authentication. After you have executed the `edit` command, the CLI prompt will be displayed as `ips{running}`. Configuration options, and sub contexts are available until you exit. To exit the edit configuration mode, enter `exit`.

The configuration mode enables administrators with the appropriate credentials to write configuration changes to the active (running) configuration. The logon account used to configure the device must either be associated with the Superuser role or the Administrator role to edit the configuration context. The configuration mode has different context levels that provide access to a specific set of configuration commands.

Note

Use debug commands only when you are instructed to do so by TippingPoint product support.

This section is divided as follows:

- *Edit context commands*
- *Contexts and related commands*

Edit context commands

aaa

Syntax

```
aaa
```

Related Commands

running-aaa Context Commands

actionsets

Enters the action sets context mode. Changes are committed and take effect immediately.

Syntax
`actionsets`

autodv

Enters Auto Digital Vaccine context mode.

Syntax
`autodv`

certificates

Enters certificates context mode.

Syntax
`certificates`

delete

Deletes file or configuration item.

Syntax

```
delete interface
```

display

Displays file or configuration item.

Syntax

```
display

Valid entries at this position are:
  <Enter>   Execute command
  CTX       Context name
  ip        Display IPv4 static routes
  ipv6      Display IPv6 static routes
  xml       Display in XML format
```

dns

Enters DNS context mode.

Syntax
`dns`

gen

Enters general context mode.

Syntax
```
gen
```

high-availability

Enters high-availability context mode.

Syntax
```
high-availability
```

interface

Enters interface context mode.

On TX Series devices, ports are presented in the format Slot-SegmentPort. For example, port 4A on slot 3 would be specified as “3-4A”.

Syntax

Configure network interface 1A in slot 3.

```
ips{}interface 3-1A
ips{running-3-1A}
```

Configure the managment interface.

```
ips{}interface mgmt
ips{running-mgmt}
```

Example settings

Setting entries depend on platform type.

Physical-media settings

Valid physical-media settings are:

10half – Supported port speed and mode

10full – Supported port speed and mode

100half – Supported port speed and mode

100full – Supported port speed and mode

auto-neg – Enable auto-negotiation (default is on)

Line speed

The line speed setting for a port.

You can set a port to 10, 100, or 1000 Kbps.

Duplex setting

The duplex setting for the port. Copper can be set to **full** or **half**. Fiber ports can be set to **full**.

Auto negotiation

The auto negotiation setting determines whether the port negotiates its speed based on the connection it

can make.

ips

Enters IPS profile context mode.

Note

When IDS mode is enabled, it adjusts the device configuration so that the device operates in a manner suitable for Intrusion Detection System (IDS) scenarios and filter configurations. When IDS Mode settings are changed, reboot the device for the change to take effect.

Syntax

```
ips
```

log

Enters log context mode. Note that the Management Console notification contact for the Audit log cannot be modified.

Syntax
```
log
```

notifycontacts

Enters notify contacts context mode.

Syntax
```
notifycontacts
```

ntp

Enters notify contacts context mode.

Syntax
```
ntp
```

reputation

Enters Reputation context mode.

Syntax
```
reputation
```

security-policy-reset

Resets IPS security policy to the default values.

Syntax
```
security-policy-reset
```

segments

Enters segments context mode, which enables you to rename segments.

Syntax

```
segments
```

services

Enters services context mode.

Syntax

```
services
```

sflow

Enter sFlow® global configuration context mode.

Syntax

```
sflow
```

snmp

Enters SNMP context mode.

Syntax

```
snmp
```

ssl-inspection

Enters SSL inspection context mode.

Syntax

```
ssl-inspection
```

Related commands

COMMAND	DESCRIPTION
certificates	Store security certificates and private keys on the TPS as device certificates.
virtual-segments	Assign an SSL inspection profile to a virtual segment.

traffic-management

Enters traffic-management profile context.

Syntax

```
traffic-management
```

virtual-segments

Enters virtual-segments context.

Syntax

```
virtual-segments
```

Contexts and related commands

running-aaa Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-aaa}delete

Delete file or configuration item.

Syntax

```
delete ldap-group (LDAPNAME|all)
delete radius-group (RADIUSNAME|all)
delete role (ROLE|all)
delete tacacs-group (TACACSNAME|all)

delete user (USER|all)
delete user-group (USERGROUP|all)
```

ips{running-aaa}display

Display configuration.

Syntax

```
  display ldap-group LDAPGROUP [xml]
  display ldap-schema LDAPSCHEMA [xml]
  display login-settings [xml]
  display password-settings [xml]
  display radius-group RADIUSGROUP [xml]
  display remote-login-group [xml]
  display role USER [xml]
  display tacacs-group [xml]
  display user USER [xml]
  display usergroup USERGROUP [xml]
```

ips{running-aaa}disable-inactive-users

Disable users who are inactive for 35 days.

Syntax

```
disable-inactive-users
```

ips{running-aaa}ldap-group

Configure LDAP group. Maximum number of groups is two.

Syntax

```
ldap-group LDAPNAME
```

ips{running-aaa}ldap-schema

Configure LDAP schema.

Syntax

```
ldap-schema SCHEMA
SCHEMA
(active-directory|novell-edirectory|fedora-ds|rfc2798|rfc2307nis|samba|custom)
```

ips{running-aaa}login

Configure login settings, including the timeout period for inactivity in the CLI and the LSM. By default, the timeout period for inactivity in the CLI and the LSM is 15 minutes.

Syntax

```
login maximum-attempts LOGINATTEMPTS
login failure-action FAILURE-ACTION
login lockout-period DURATION
login cli-inactive-timeout [MINUTES]
login lsm-inactive-timeout [MINUTES]
```

Example of how to set a login failure action

```
ips{running-aaa}login failure-action lockout
```

Example of help for login settings

```
ips{running-aaa}help login
```

ips{running-aaa}login-banner

Configure login banner settings, including title and banner text.

Syntax

```
login-banner (enable|disable)
login-banner text (1500 character max)
login-banner title (50 character max)
```

ips{running-aaa}password

Configure password settings.

Syntax

```
password quality (none|low|medium|high)
password expiry-time (10d|20d|30d|45d|60d|90d|6m|1y)
password expiry-action (force-change|notify-user|disable-account)
password disallow-reuse (enable|disable)
password min-lifetime (enable|disable)
```

Restrictions for the password security levels are as follows:

- **None** – User names cannot contain spaces. The maximum password length is 32 characters.
- **Low** – The same user name and password requirements as the None setting, plus the following additional requirements:
  - User names must be at least six characters in length
  - A new password must be different than the current password, and passwords must be at least eight characters in length
- **Medium** – The same user name and password requirements as the Low setting, plus the following additional password complexity requirements:

  - Contains at least two alphabetic characters
  - Contains at least one numeric character
  - Contains at least one non-alphanumeric character (examples include `! ? $ * #`). Do not use spaces in the password.
- **High** – The same user name and password requirements as the Medium setting, but passwords must be at least 15 characters and meet the following additional password complexity requirements:
  - Contains at least one uppercase character
  - Contains at least one lowercase character
  - At least half the characters cannot occupy the same positions as the current password.

The default is **Medium**.

ips{running-aaa}radius-group

Configure Radius group. Maximum number of radius groups is 2.

Syntax

```
radius-group RADIUSNAME
```

ips{running-aaa}remote-login-group

Configure LDAP, RADIUS group, or TACACS+ group to use for administrative login.

The name you provide for each group cannot be changed. To give a group a new name, you must delete the group and re-create it with the new name.

Note

Both RADIUS and TACACS+ authentication use protocols that are not FIPS-compliant. Before configuring RADIUS or TACACS + for remote authentication, disable FIPS mode. For more information, see *fips-mode-enable*.

Syntax

```
remote-login-group (administrator) (GROUP|none)
```

ips{running-aaa}role

Configure an access role.

Syntax

```
role ROLE [OLDROLE]
```

ips{running-aaa}tacacs-group

Configure TACACS+ group. Maximum number of TACACS+ groups is two.

Syntax

```
tacacs-group TACACSNAME
```

ips{running-aaa}user

Configure a name identified user. When you enter a username that does not exist, a new user is created.

Syntax

```
user NAME
```

ips{running-aaa}user-group

Configure a name identified usergroup.

Syntax

```
user-group GROUPNAME
```

running-aaa-ldap-group-X Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-aaa-ldap-group-mygroup1}base-dn

Configure base distinguished name (DN).

Syntax

```
base-dn DN
```

ips{running-aaa-ldap-group-mygroup1}bind-dn

Configure bind distinguished name (DN).

Syntax

```
bind-dn DN
```

ips{running-aaa-ldap-group-mygroup1}delete

Delete file or configuration item.

Syntax

```
delete server (ADDRESS|all)
```

ips{running-aaa-ldap-group-mygroup1}port

Configure LDAP port.

Syntax

```
port <0-65535>
```

ips{running-aaa-ldap-group-mygroup1}retries

Configure server(s) retries.

Syntax

```
retries RETRY
```

ips{running-aaa-ldap-group-mygroup1}server

Configure LDAP server address.

Syntax

```
server (A.B.C.D|X:X::X:X) priority (1-6)
```

ips{running-aaa-ldap-group-mygroup1}timeout

Configure timeout.

Syntax

```
timeout SECONDS
```

ips{running-aaa-ldap-group-mygroup1}tls

Configure TLS.

Syntax

```
tls (enable|disable)
tls start-tls (enable|disable)
tls require-valid-server-cert (enable|disable)
```

running-aaa-radius-group-X Context Commands

ips{running-aaa-radius-group-2}default-usergroup

Default usergroup.

Syntax

```
default-usergroup GROUP|none
```

ips{running-aaa-radius-group-2}delete

Delete file or configuration item.

Syntax

```
delete server (A.B.C.D|X:X::X:X|all)
```

ips{running-aaa-radius-group-2}auth-type

Specifies the authentication protocol for the RADIUS group. When the authentication protocol is PEAP/EAP-MSCHAPv2, be sure to also import the CA root certificate. The RADIUS group authenticates against the available CA root certificates on the device.

Syntax

```
auth-type PAP|MD5|PEAP/EAP-MSCHAPv2
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}ca-certificate	Import a CA certificate.

ips{running-aaa-radius-group-2}retries

Configure server retries.

Syntax

```
retries (0-3)
```

ips{running-aaa-radius-group-2}server

Configure server.

Syntax

```
server (A.B.C.D|X:X::X:X) [PORT] password PASSWORD priority (1-6)
timeout (1-10) [nas-id NASID]
```

running-aaa-tacacs-group-X Context Commands

ips{running-aaa-tacacs-group-group1}auth-type

Specifies the authentication protocol for the TACACS+ group. Supported protocols include ASCII, PAP, and CHAP. The TACACS+ group authenticates against the available CA root certificates on the device.

Syntax

```
auth-type ASCII|PAP|CHAP
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}ca-certificate	Import a CA certificate.

ips{running-aaa-tacacs-group-group1}default-usergroup

Default usergroup. The default is operator.

Syntax

```
default-usergroup GROUP
```

ips{running-aaa-tacacs-group-group1}delete

Delete file or configuration item.

Syntax

```
delete server (A.B.C.D|X:X::X:X|all)
```

ips{running-aaa-tacacs-group-group1}retries

Configure server retries.

Syntax

```
retries (0-3)
```

ips{running-aaa-tacacs-group-group1}server

Configure TACACS+ server.

Syntax

```
server (A.B.C.D|X:X::X:X) [PORT] secret SECRET priority (1-6)
timeout (1-15)
```

running-actionsets Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-actionsets}actionset

Enter an action set context with defined name.

Syntax

```
actionsets ACTIONSETNAME
```

ips{running-actionsets}rename

Rename action set.

Syntax

```
rename actionset ACTIONSETNAME NEWACTIONSETNAME
```

running-actionsets-X Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-actionsets-myactionset1}action

Delete file or configuration item.

Set action type. Available values: permit, rate-limit, block, trust.

Immediate Commit Feature. Changes take effect immediately.

Syntax

```
action (permit|rate-limit|block|trust)
```

ips{running-actionsets-myactionset1}allow-access

Allow quarantined host to access defined IP.

Syntax

```
allow-access DESTIP
```

ips{running-actionsets-myactionset1}bytes-to-capture

Set bytes to capture for packet trace.

Syntax

```
bytes-to-capture BYTES
```

ips{running-actionsets-myactionset1}delete

Delete file or configuration item.

Syntax

```
delete allow-access DESTIP
delete contact XCONTACTNAME
delete limit-quarantine SOURCEIP
delete no-quarantine SOURCEIP
```

ips{running-actionsets-myactionset1}http-block

Set quarantine option to block HTTP traffic.

Syntax

```
http-block
```

ips{running-actionsets-myactionset1}http-redirect

Set redirect URL for HTTP redirect option.

Syntax

```
http-redirect URL
```

ips{running-actionsets-myactionset1}http-showdesc

Set or clear HTTP show description display option.

Syntax

```
http-showdesc (enable|disable)
```

ips{running-actionsets-myactionset1}limit-quarantine

Add IP for limit quarantine.

Syntax

```
limit-quarantine SOURCEIP
```

ips{running-actionsets-myactionset1}packet-trace

Configure packet trace option.

Syntax

```
packet-trace (enable|disable|delete|download)
```

ips{running-actionsets-myactionset1}priority

Set packet trace priority.

Syntax

```
priority PRIORITY
```

ips{running-actionsets-myactionset1}quarantine

Set quarantine option. Available options: no, immediate, threshold.

Syntax

```
quarantine QUARANTINETYPE
```

ips{running-actionsets-myactionset1}tcp-reset

Set tcp reset option for block action. Available options: none (disable), source, dest, or both.

Syntax

```
tcp-reset (none|source|dest|both)
```

ips{running-actionsets-myactionset1}threshold

Set quarantine threshold value.

Syntax

```
threshold (2-10000) (1-60)
```

ips{running-actionsets-myactionset1}verbosity

Set packet trace verbosity.

Syntax

```
verbosity (partial|full)
```

running-autodv Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-autodv}calendar

Enter Calender Style.

Syntax

```
calendar
```

ips{running-autodv}delete

Delete file or configuration item.

Syntax

```
delete proxy
delete proxy-password
delete proxy-username
```

ips{running-autodv}disable

Disable service.

Syntax

```
disable
```

ips{running-autodv}enable

Enable service.

Syntax

```
enable
```

ips{running-autodv}list

List Installed Digital Vaccines.

Syntax

```
list
```

ips{running-autodv}periodic

Enter Periodic Style.

Syntax

```
periodic
```

ips{running-autodv}proxy

Configures a proxy server.

Syntax

```
proxy ADDR port PORT
```

ips{running-autodv}proxy-password

Sets a password for a proxy server.

Syntax

```
proxy-password PASSWD
```

ips{running-autodv}proxy-username

Sets a password for a proxy server.

Syntax

```
proxy-username USER
```

ips{running-autodv}update

Update AutoDV.

Syntax

```
update
```

running-autodv-periodic Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-autodv-periodic}day

Day of the week to update.

Syntax

```
day (Sunday|Monday|Tuesday|Wednesday|Thursday|Friday|Saturday)
```

ips{running-autodv-periodic}period

Set number of days between update checks.

Syntax

```
period PERIOD
PERIOD Value range is 0 - 99, unit is days
```

ips{running-autodv-periodic}time

Time of day to check for updates.

Syntax

```
time HOURS:MINUTES
HOURS Value range is 0 - 23
MINUTES Value range is 0 - 59
```

running-certificates Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-certificates}certificate

Add or update a device certificate with the certificate contents from your web server. To inspect secure sessions, the TPS requires both the certificate and private key from your web server.

(Best Practice) Name the certificate so that you can safely and reliably assign it to the correct SSL server.

When the keystore mode is **sms-managed**, use the SMS to manage device certificates and private keys.

Syntax

```
certificate CERTNAME
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}private-key	Import the private key from your web server into the local keystore on the TPS device.
ips{running-sslinsp}server	Add an SSL server to the TPS device with the same security settings as your web server, and assign the corresponding certificate and private key.

ips{running-certificates}ca-certificate

Add CA certificate.

Syntax

```
ca-certificate CANAME
```

ips{running-certificates}delete

Delete file or configuration item.

Syntax

```
delete ca-certificate (all|CANAME)
```

ips{running-certificates}display

Display file or configuration item.

Syntax

```
display ca-certificate CANAME [pem|text]
```

ips{running-certificates}private-key

Import a private key into the keystore on the device and assign it to the specified device certificate. Use the **save-config** command to secure the private key in the keystore.

To inspect secure sessions, the TPS requires both the certificate and private key from your web server.

When the keystore mode is **sms-managed**, this command is not applicable. Use the SMS to manage device certificates and private keys.

Syntax

```
private-key CERTNAME
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}certificate	Import the certificate from your web server into the local keystore on the TPS device.
ips{running-sslinsp}server	Add an SSL server to the TPS device with the same security settings as your web server, and assign the corresponding certificate and private key.

running-dns Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-dns}delete

Immediate Commit Feature. Changes take effect immediately. Delete file or configuration item. A secondary domain-search can only be deleted if no tertiary exists. A primary domain-search can only be deleted if no secondary exists.

Syntax

```
delete domain-name
delete domain-search (primary|secondary|tertiary|all)
delete name-server (all|A.B.C.D|X:X::X:X)
delete proxy cache cleaning interval
delete proxy cache forwarder (all|A.B.C.D|X:X::X:X)
delete proxy cache maximum negative ttl
delete proxy cache maximum ttl
delete proxy cache size
```

ips{running-dns}domain-name

Immediate Commit Feature. Changes take effect immediately. Configure domain name.

Syntax

```
domain-name NAME
```

ips{running-dns}domain-search

Immediate Commit Feature. Changes take effect immediately. Configure domain search. A secondary domain-search can only be entered after a primary is entered and a tertiary can only be entered after a secondary is entered.

Syntax

```
domain-search (primary|secondary|tertiary) NAME
```

ips{running-dns}name-server

Configure DNS server.

Syntax

```
name-server (A.B.C.D|X:X::X:X)
```

ips{running-dns}proxy

Configure proxy.

Syntax

```
proxy (enable|disable)
proxy cache cleaning interval cache cleaning interval in minutes
proxy cache forwarder A.B.C.D|X:X::X:X
proxy cache maximum negative ttl cache maximum negative ttl in minutes
proxy cache maximum ttl cache maximum ttl in minutes
proxy cache size cache size in megabytes
```

running-gen Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-gen}delete

Delete file or configuration item.

Syntax

```
delete host (NAME|all)
```

ips{running-gen}ephemeral-port-range

Set the range of the ephemeral port (default is 32768-60999).

Syntax

```
ephemeral-port-range (default|(LOWRANGE HIGHRANGE))
default Default port range value 32768-60999 is applied
LOWRANGE Value of the first port
HIGHRANGE Value of the last port
```

ips{running-gen}host

Configure static address to host name association.

Syntax

```
host NAME (A.B.C.D|X:X::X:X)
```

ips{running-gen}https

Disable and enable HTTPS access on the TPS management port. By default, HTTPS access is enabled to allow access to the device through the LSM, and to enable the Security Management System (SMS) to manage the device.

Note that this command does not disable SSH access on the TPS management port. See *ips{running-gen}ssh* for more information.

Syntax

```
https (enable|disable)
```

ips{running-gen}lsm

Disable and enable the LSM.

Syntax

```
lsm (enable|disable)
```

ips{running-gen}sms-allowed-ip

Configure allowed SMS IP addresses.

Syntax

```
sms-allowed-ip A.B.C.D (IPv4 address)
sms-allowed-ip A.B.C.D/M (IPv4 address with netmask)
sms-allowed-ip  X:X::X:X (IPv6 address)
sms-allowed-ip  X:X::X:X/M (IPv6 address with prefix length)
sms-allowed-ip all (All SMS IP addresses are allowed)
```

ips{running-gen}ssh

Disable and enable SSH access on the TPS management port. By default, SSH access is enabled to allow CLI access to the device.

When the SSH connection to a remote syslog breaks, the device automatically attempts to reconnect three times over the course of a minute (once every 20 seconds for one minute). Each failed attempt is logged locally, and if the connection is still broken after one minute, the device stops attempting to reconnect.

If the automatic attempts to reconnect fail, you must manually bring back up the SSH connection by disabling and then re-enabling the "Remote System Log" configuration. Any data that was queued before the connection was lost gets sent after the connection is re-established. All data is sent in real time.

Note that this command does not disable HTTPS access on the TPS management port. See *ips{running-gen}https* for more information.

Syntax

```
ssh (enable|disable)
```

Learn more about SSH configuration.

ips{running-gen}timezone

Display or configure time zone.

Note

Use the `US` option to specify a standard time zone in the United States.

Syntax

```
timezone GMT
timezone REGION CITY
REGION
(Africa|America|Antarctica|Arctic|Asia|Atlantic|
Australia|Europe|Indian|US|Pacific)
```

ips{running-gen}tls

Enable or disable TLS versions on the management interface.

Disable older TLS versions to secure the management interface. When deciding which TLS versions to disable, keep in mind that the LSM, SMS, and Captive Portal communicate through the device's management interface.

Syntax

```
tls (TLSv1.0 |TLSv1.1 |TLSv1.2 )(enable|disable)
```

running-high-availability Context Commands

Create or enter a high-availability context.

ips{running-high-availability}disable

Disables HA.

Syntax

```
disable
```

ips{running-high-availability}enable

Enables high-availability on the local device.

Syntax

```
enable
```

ips{running-high-availability}encryption

Applies encryption hash for a passphrase.

Syntax

```
encryption (passphrase PASSPHRASE)|enable|disable
```

ips{running-high-availability}partner

Specifies the HA partner.

For 440T and 2200T devices that use the HA port, enter the partner device serial number. For TX Series devices that use the MGMT port, enter the partner device MGMT port IP address.

Syntax

HA port:

```
partner SERIAL
```

MGMT port:

```
partner IP ADDRESS
```

running-inspection-bypass Context Commands

Enables, disables, or removes inspection bypass rules. Inspection bypass rules direct traffic through the TippingPoint TPS devices without inspection. You can view a list of current inspection bypass rules with the **display** command.

Important

When creating an inspection bypass rule that includes source and destination ports or IP addresses, you must first specify the IP protocol as UDP or TCP.

You can now define up to 32 inspection bypass rules on a TippingPoint TPS. Rule configurations that bypass IPv6 traffic or VLAN ranges require additional hardware resources. For example, a single inspection bypass rule for IPv6 or VLAN traffic can result in multiple port-VLAN rule combinations.

Inspection bypass rule	Resulting number of port-VLAN rule combinations
IPv4 traffic on TCP 1556 with untagged traffic or a particular VLAN ID	1
IPv6 traffic on TCP 1556 with untagged traffic or a particular VLAN ID	2
IPv4 traffic on TCP 1556 with VLAN 10 – 100	90
IPv6 traffic on TCP 1556 with VLAN 10 – 100	180

Each TPS supports a maximum number of port-VLAN rule combinations. If the number of configured port-VLAN rule combinations exceeds the maximum threshold for the device, you cannot commit the changes.

For a	Maximum (approximate) number of port-VLAN rule combinations
440T	256 when bypassing IPv4 128 when bypassing IPv6 traffic
2200T	2560 when bypassing IPv4 traffic 1280 when bypassing IPv6 traffic
1100TX	448 when bypassing IPv4 traffic 256 when bypassing IPv6 traffic
5500TX	1792 when bypassing IPv4 traffic 1024 when bypassing IPv6 traffic
8200TX	512 when bypassing IPv4 or IPv6 traffic
8400TX	512 when bypassing IPv4 or IPv6 traffic

Syntax

Type **help** and press Enter for more information.

```
ips{running-inspection-bypass}help
Valid commands are:
```

```
delete RULENAME
help [full|COMMAND]
rule NEWRULENAME
rule RULENAME
```

When you edit or create an inspection bypass rule, the context changes to that rule.

From the context of an inspection bypass rule, type **help** and press Enter for a list of commands, or type **help command** for help on a particular command.

ips{running-inspection-bypass-rule-myrule1}action

Specify which action the rule applies to the traffic.

Syntax

```
ips{running-inspection-bypass-rule-myrule1}action <action> [PORTNAME]
```

Note

Redirect and Mirror options are not supported for inspection bypass when there are no target ports available.

To block incoming traffic:

```
ips{running-inspection-bypass-rule-myrule1}action block
```

To copy traffic entering the port and send it to segment port 5B before the traffic gets inspected:

```
ips{running-inspection-bypass-rule-myrule1}action ingress-mirror 5B
```

ips{running-inspection-bypass-rule-myrule1}eth

Specifies the Ethernet Type that you do not want to inspect. When you define an inspection bypass rule, an option without a specified value defaults to a value of "any". For example, if you do not specify a value for **eth**, it defaults to a value of any Ethernet Type.

Enter **help eth** and press Enter to display options for specifying an EtherType. Note that a value of **ip** specifies both IPv4 and IPv6.

Note

A full list of Ethernet Type values can be found at the Internet Assigned Numbers Authority website. When specifying an Ethernet Type as a hexadecimal value, prepend 0x, for example, 0x0806 for ARP.

ips{running-inspection-bypass-rule-myrule1}ip-proto

Specifies the IP protocols that you do not want to inspect. When you define an inspection bypass rule, an option without a specified value defaults to a value of "any". For example, if you do not specify a value for **ip-proto**, it defaults to a value of **any** IP protocol.

If you change the IP protocol to a protocol other than TCP or UDP, the corresponding TCP or UDP ports are automatically removed. Edit an inspection bypass rule and enter **ip-proto udp** to not inspect UDP traffic.

Note

A full list of IP protocol values can be found at the Internet Assigned Numbers Authority website at http://www.iana.org/assignments/protocol-numbers.

Syntax

Enter **help ip-proto** and press Enter to display options for specifying an IP protocol.

```
ips{running-inspection-bypass-rule-myrule1}help ip-proto
Enter ip protocol for inspection bypass rule
Syntax: ip-proto PROTO_OPTION|PROTO_VALUE
  ip-proto       Enter ip protocol for inspection bypass rule
  PROTO_OPTION   Enter ip protocol (udp or tcp) for inspection bypass rule
    Possible values for PROTO_OPTION are:
    udp            udp protocol
    tcp            tcp protocol
    PROTO_VALUE    Enter ip protocol value (e.g. 115 for L2TP)
```

ips{running-inspection-bypass-rule-myrule1}vlan-id

Specifies the VLAN traffic that you do not want to inspect. When you define an inspection bypass rule, an option without a specified value defaults to a value of "any". For example, if you do not specify a value for **vlan-id**, it defaults to **all** tagged and untagged traffic.

Syntax

Enter **help vlan-id** and press Enter to display options for specifying a range of VLAN IDs.

```
ips{running-inspection-bypass-rule-myrule1}help vlan-id
Valid commands are:
  vlan-id none
  vlan-id VLANID
  vlan-id range MINVLANID MAXVLANID
```

Edit an inspection bypass rule and enter **vlan-id none** to not inspect untagged VLAN traffic. Then, type **display** and press Enter to view your change.

running-interface Context Commands

Create or enter an interface context.

ips{running}interface nM

Enters context for configuring Ethernet settings. The port name, for example, 1A, is case-sensitive.

Syntax

```
interface nM
Valid entries at this position are:
  delete               Delete file or configuration item
  help                 Display help information
  physical-media       Configure ethernet port settings
  restart              Restart Ethernet port
  shutdown             Shutdown logical interface state
```

ips{running}interface mgmt

Enters context for configuring management settings.

Syntax

```
interface mgmt
Valid entries at this position are:
  delete               Delete file or configuration item
```

```
  description          Enter description for the management interface
  help                 Display help information
  host                 Configure host name, location, or contact
  ip-filter            Limit which ip addresses can access mgmt port
  ipaddress            Configure IP address
  physical-media       Configure mgmt port speed/duplex
  route                Add IPv4/IPv6 static route
```

running-ips Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-ips}afc-mode

Configures AFC mode.

Syntax

```
afc-mode AFCMODE
```

ips{running-ips}afc-severity

Configures AFC severity level.

Syntax

```
afc-severity SEVERITY
```

ips{running-ips}asymmetric-network

Configures asymmetric network mode.

Syntax

```
asymmetric-network enable | disable
```

ips{running-ips}connection-table

Configures connection table timeout.

Syntax

```
connection-table TIMEOUTTYPE SECONDS
TIMEOUTTYPE         Connection table timeout type
Possible values for TIMEOUTTYPE are:
non-tcp-timeout     Connection table non-tcp timeout
timeout             Connection table timeout
trust-timeout       Connection table trust timeout
SECONDS             Connection table timeout seconds
```

ips{running-ips}delete

Allows you to delete a profile.

Syntax

```
delete profile XPROFILENAME
```

ips{running-ips}deployment-choices

Lists deployment choices. Note that the deployment options displayed will vary according to the Digital Vaccine (DV) that is installed.

Syntax

```
deployment (Aggressive|Core|Default|Edge|Perimeter)
```

Note

Enter the full deployment name without quotes, including any `[DEPRECATED]` label.

ips{running-ips}display

Display all IPS configuration and profiles.

Syntax

```
display
```

ips{running-ips}display-categoryrules

Display category rules for all profiles.

Syntax

```
display-categoryrules
```

ips{running-ips}gzip-decompression

Sets GZIP decompression mode.

Syntax

```
gzip-decompression (enable|disable)
```

ips{running-ips}http-encoded-resp

Configures inspection of encoded HTTP responses.

Syntax

```
http-encoded-resp (accelerated|inspect url-ncr STATUS)|ignore
 accelerated   Accelerated inspection of encoded HTTP responses
 ignore        Ignore encoded HTTP responses
 inspect       Inspect encoded HTTP responses
```

ips{running-ips}http-mode

Configures HTTP mode, which allows all TCP ports to be treated as HTTP ports for inspection purposes. If a flow does not have HTTP traffic, HTTP processing stops so that optimum performance is maintained.

Syntax

```
http-mode enable | disable
```

ips{running-ips}profile

Allows you to create or enter an IPS profile and configure whether the True-Client-IP address and additional HTTP context information are collected for the profile.

Syntax

```
profile PROFILENAME client-ip [enable|disable] http-context [enable|disable]
```

ips{running-ips}quarantine-duration

Sets quarantine duration.

Syntax

```
quarantine-duration DURATION
DURATION value between 1 to 1440 minutes
```

ips{running-ips}rename

Renames a profile.

Syntax

```
rename profile PROFILENAME NEWPROFILENAME
```

running-ips-X Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-ips-1}categoryrule

Enters categoryrule context.

Syntax

```
categoryrule
```

ips{running-ips-1}delete

Delete file or configuration item.

Syntax

```
delete filter FILTERNUMBER
FILTERNUMBER Existing filter number
```

ps{running-ips-1}deployment

Specify a profile deployment. Deployment options will vary according to the Digital Vaccine (DV) that is installed.

Syntax

```
deployment DEPLOYMENTNAME
```

Note

Enter the full deployment name without quotes, including any `[DEPRECATED]` label.

ips{running-ips-1}description

Edit description for a profile.

Syntax

```
description DESCRIPTION
```

ips{running-ips-1}filter

Creates or enters a filter context.

Syntax

```
filter FILTERNUMBER
```

running-log Context Commands

Create or enter a running-log context.

ips{running-log}delete

Delete file or configuration item.

Syntax

```
  delete log audit CONTACT-NAME
  delete log quarantine CONTACT-NAME
  delete log system CONTACT-NAME
  delete log-option xmsd( all)|( LOG_OPTION)
  delete logging-mode
  help [full|COMMAND]
  log audit CONTACT-NAME [ALL|none]
  log quarantine CONTACT-NAME [ALL|none]
  log system CONTACT-NAME [SEVERITY]
  log-option xmsd( all)|( LOG_OPTION)
  logging-mode unconditional|(conditional [threshold PERCENTAGE] [period TIMEOUT])
  sub-system SUBSYSTEM [SEVERITY]
```

ips{running-log}log

Add log to a log session.

Syntax

```
 log audit CONTACT-NAME [ALL|none]
  log quarantine CONTACT-NAME [ALL|none]
  log system CONTACT-NAME [SEVERITY]
Valid entries at this position are:
  <Enter>      Execute command
  audit        Configure log for audit services
  quarantine   Configure log for quarantine services
  system       Configure log for all services
```

ips{running-log}log-option

Add service log option.

Syntax

```
log-option xmsd( all)|( LOG_OPTION)
  log-option   Add service log option
  xmsd         Configure xmsd log options
  all          Enable logging all options
  LOG_OPTION   Log-option item for XMSD
    Possible values for LOG_OPTION are:
```

```
    segments               Enable logging segments
    mgmt                   Enable logging mgmt
    interface              Enable logging interface
    xms_configure          Enable logging xms configure
    xms_process            Enable logging xms process
    xms_stream             Enable logging xms stream
    aaa                    Enable logging aaa
    dns                    Enable logging dns
    ethernet               Enable logging ethernet
    highavailability       Enable logging highavailability
    linkmonitor            Enable logging linkmonitor
    log                    Enable logging log
    ntp                    Enable logging ntp
    ports                  Enable logging ports
    services               Enable logging services
    udm-conf-handler       Enable logging UDM configuration handler
    snmp                   Enable logging snmp
    system                 Enable logging system
    qos                    Enable logging qos
    virtual-segments       Enable logging virtual-segments
    xmsupdate              Enable logging xmsupdate
    vrf                    Enable logging vrf
    x509                   Enable logging x509
    xipc                   Enable logging xipc requests
    trafficlights          Enable logging trafficlights requests
    vlan-translations      Enable logging vlan-translations
```

ips{running-log}logging-mode

Configure logging behavior when the system is congested.

Syntax

```
  logging-mode unconditional|(conditional [threshold PERCENTAGE]
               [period TIMEOUT])
  logging-mode    Configure logging behavior when the system is congested
  unconditional   Always log even if traffic is dropped under high load
  conditional     Disable logging if needed to prevent congestion (default)
  threshold       Congestion threshold at which to disable logging (default: 1.0%)
  PERCENTAGE      Congestion percentage (0.1% to 99.9%)
  period          Amount of time to disable logging (default: 600 seconds)
  TIMEOUT         Log disable time in seconds (60 to 3600)
```

ips{running-log}sub-system

Sets sub-system log level.

Syntax

```
 sub-system SUBSYSTEM [SEVERITY]
sub-system (COROSYNC|HTTPD|INIT|LOGIN|TOS|XMS|CRMADMIN)
[alert|critical|debug|emergency|error|info|notice|warning|none]
Possible values for SEVERITY are:
emergency Panic condition messages (TOS critical)
alert Immediate problem condition messages
critical Critical condition messages
error Error messages
warning Warning messages
notice Special condition messages
info Informational messages
```

```
debug Debug messages
debug0 TOS Debug0 messages
debug1 TOS Debug1 messages
debug2 TOS Debug2 messages
debug3 TOS Debug3 messages
none Turn off messages
```

running-notifycontacts (email) Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-notifycontacts}contact

Create or edit a notify contact.

Syntax

```
contact CONTACTNAME
contact NEWNAME email
contact NEWNAME snmp COMMUNITY IP [PORT]
```

ips{running-notifycontacts}delete

Delete a contact or an email setting.

Syntax

```
delete contact XCONTACTNAME
 delete EMAILSETTING
```

ips{running-notifycontacts}email-from-address

From email address.

Syntax

```
email-from-address EMAIL
```

ips{running-notifycontacts}email-from-domain

From domain name.

Syntax

```
email-from-domain DOMAIN
```

ips{running-notifycontacts}email-server

Set mail server IP.

Syntax

```
email-server IP
```

ips{running-notifycontacts}email-threshold

Set email threshold per minute

Syntax

```
email-threshold THRESHOLD
  THRESHOLD   Threshold-value, value range 1-35 per minute
```

ips{running-notifycontacts}email-to-default-address

Default to email address.

Syntax

```
email-to-default-address EMAIL
```

ips{running-notifycontacts}rename

Rename contact with new name.

Syntax

```
rename contact XCONTACTNAME NEWNAME
```

running-ntp Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-ntp}delete

Delete file or configuration item.

Syntax

```
delete key (all|ID)
delete server (all|HOST)
Valid entries:
key Delete key from configuration
all Delete all keys
ID Key identifier
server Delete remote NTP server
all Delete all servers
HOST Remote server address or name
```

ips{running-ntp}key

Configure NTP authentication key.

Syntax

```
key (1-65535) VALUE
Valid entries:
(1-65535) Key ID, required for authentication
VALUE Key value (1-20 characters)
```

ips{running-ntp}ntp

Enable or disable NTP service.

Syntax

```
ntp (enable|disable)
```

ips{running-ntp}polling-interval

Configure NTP server minimum polling interval.

Syntax

```
polling-interval SECONDS
SECONDS Interval in seconds
Possible values for SECONDS are:
2 2 seconds
4 4 seconds
8 8 seconds
16 16 seconds
32 32 seconds
64 64 seconds
```

ips{running-ntp}server

Configure remote NTP server.

Syntax

```
server (dhcp|A.B.C.D|X:X::X:X|FQDN) [key ID] [prefer]
dhcp   Get server address from dhcp
NAME   NTP remote server
key    Key to be used
ID     Key identifier
prefer Mark server as preferred
```

running-rep Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-rep}delete

Delete file or configuration item.

Syntax

```
delete group USERGROUP
delete profile XPPROFILENAME
Valid entries:
group   Reputation group
profile Delete reputation profile
```

ips{running-rep}group

Create or enter reputation group context.

Syntax

```
group USERGROUP
Valid entries:
USERGROUP   Reputation usergroup name
```

ips{running-rep}nxdomain-response

Responds with `NXDOMAIN (name does not exist)` to clients that make DNS requests for hosts that are blocked.

Syntax

```
nxdomain-response (enable|disable)
```

ips{running-rep}profile

Create or enter reputation profile context.

Syntax

```
profile PROFILENAME
```

ips{running-rep}rename

Rename a reputation profile or group.

Syntax

```
rename group USERGROUP NEWUSERGROUP
rename profile XPROFILENAME NEWPROFILENAME
Valid entries:
group   Reputation group
profile Reputation profile
```

running-rep-X (group X) Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-rep-1}delete

Delete file or configuration item.

Syntax

```
delete domain DOMAINNAME
delete ip (A.B.C.D|A.B.C.D/M|X:X::X:X|X:X::X:X/M)
Valid entries:
domain   Domain name
ip       IP address IPv4/IPv6/CIDR
```

ips{running-rep-1}description

Add a description to the reputation group.

Syntax

```
description DESCRIPTION
```

ips{running-rep-1}domain

New domain name.

Syntax

```
domain NEWDOMAIN
```

ips{running-rep-1}ip

New IP address (IPv5/IPv6/CIDR).

Syntax

```
ip IPADDRESS
```

running-rep-X (profile X) Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-rep-abc}action-when-pending

Set pending action to permit or drop.

Syntax

```
action-when-pending (permit|drop)
```

ips{running-rep-abc}check-destination-address

Enables or disables check destination address.

Syntax

```
check-destination-address (enable|disable)
```

ips{running-rep-abc}check-source-address

Enables or disables check source address.

Syntax

```
check-source-address (enable|disable)
Valid entries:
enable  Enable check source address
disable Disable check source address
```

ips{running-rep-abc}delete

Delete file or configuration item.

Syntax

```
delete dns-except DOMAINNAME
delete filter REPGROUP
delete ip-except (A.B.C.D|A.B.C.D/M|X:X::X:X|X:X::X:X/M)
(A.B.C.D|A.B.C.D/M|X:X::X:X|X:X::X:X/M)
```

ips{running-rep-abc}dns-except

DNS domain exception.

Syntax

```
dns-except DOMAINNAME
```

ips{running-rep-abc}filter

Add a reputation filter rule.

Syntax

```
filter ALLGROUPNAME(enable [threshold [XACTIONSETNAME]])|
       (disable)
```

```
Valid entries:
enable Enable filter rule
THRESHOLD  Set threshold (0-100)
XACTIONSETNAME  Apply action set name
disable    Disable filter rule
```

ips{running-rep-abc}ip-except

Add IP address exception.

Syntax

```
ip-except SOURCEIP DESTINATIONIP
SOURCEIP A.B.C.D or A.B.C.D/M or X:X::X:X or X:X::X:X/M
DESTINATIONIP A.B.C.D or A.B.C.D/M or X:X::X:X or X:X::X:X/M
```

security-policy-reset

Resets the IPS security policy to the default values.

Syntax

```
security-policy-reset
```

running-segments-segmentX Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-segments-segment0}description

Apply segment description.

Syntax

```
description TEXT
```

ips{running-segments-segment0}display

Display a segment configuration.

Syntax

```
display
```

ips{running-segments-segment0}high-availability

Intrinsic HA Layer 2 Fallback action block or permit.

Syntax

```
high-availability (block|permit)
block  Enable block all
permit Enable permit all
```

ips{running-segments-segment0}link-down

Link down synchronization mode.

Syntax

```
link-down breaker [wait-time WAIT-TIME]
link-down hub
link-down wire [wait-time WAIT-TIME]
Valid entries:
breaker     Enable breaker action
hub         Enable hub action
wire        Enable wire action
WAIT-TIME   Time to wait before synchronizing in seconds
```

ips{running-segments-segment0}restart

Restart both ethernet ports of segment.

Syntax

```
restart
```

ips{running-segments-segment0}sflow

Configure sFlow packet export.

Syntax

```
sflow enable sample-rate [SAMPLE-RATE]|disable
```

running-services Context Commands

Immediate Commit Feature. Changes take effect immediately.

Syntax

```
ips{}edit
ips{running}services
Entering Immediate Commit Feature. Changes take effect immediately.
ips{running-services}
Valid entries at this position are:
  display              Display all services
  help                 Display help information
  service              Edit a service
ips{running-services}help service
Edit a service
Syntax: service SERVICE
  service   Edit a service
  SERVICE   Service name

ips{running-services}service portmapper
ips{running-services-portmapper}
Valid entries at this position are:
  delete               Delete file or configuration item
  display              Display service configuration
  help                 Display help information
  port                 Add port(s) to service

ips{running-services-portmapper}display
  # DEFAULT ENTRIES
  port tcp 111
  port tcp 32770 to 32779
  port udp 111
  port udp 32770 to 32779
```

```
  exit
ips{running-services-portmapper}help port
Add port(s) to service
Syntax: port tcp PORT [to LAST-PORT]
        port udp PORT [to LAST-PORT]
  port        Add port(s) to service
  tcp         TCP
  PORT        Port number
  to          Enter range of ports
  LAST-PORT   Last port of range
  udp         UDP

ips{running-services-portmapper}help delete port
Delete port(s) from service
Syntax: delete port tcp PORT [to LAST-PORT]
        delete port udp PORT [to LAST-PORT]
  delete      Delete file or configuration item
  port        Delete port(s) from service
  tcp         TCP
  PORT        Port number
  to          Enter range of ports
  LAST-PORT   Last port of range
  udp         UDP
```

Notes

- You cannot create new services.
- You cannot delete services.
- You cannot delete the set of default ports assigned to services.
- You can add additional ports to a service.
- You can delete user-added ports from a service.
- TCP or UDP option is available depending on the service (some services are TCP only).

ips{running-services}display

Display service(s).

Syntax

```
display service (all|SERVICENAME)
```

ips{running-services}service

Edit a service.

Syntax

```
service SERVICENAME
```

running-services-X Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-services-myservice1}delete

Delete service parameters.

Syntax

```
delete icmp (all|NAME|NUMBER)
delete icmpv6 (all|NAME|NUMBER)
delete port tcp PORT [to LASTPORT]
delete port udp PORT [to LASTPORT]
delete port tcp all
delete port udp all
delete protocol (all|PROTONUM)
delete service (all|SERVICENAME)
Valid entries:
icmp      Delete ICMPv4
icmpv6    Delete ICMPv6
port      Delete port(s)
protocol  Delete packet protocol number(s)
service   Delete member service
```

ips{running-services-myservice1}port

Apply TCP or UDP port number.

Syntax

```
port tcp PORT [to LASTPORT]
port udp PORT [to LASTPORT]
Valid entries:
tcp       Apply TCP
PORT      Apply port number
to        Set port range to
LAST-PORT Apply last port of range
udp       Apply UDP
```

running-snmp Context Commands

Immediate Commit Feature. Changes take effect immediately.

ips{running-snmp}authtrap

Enable or disable SNMP authentication failure trap.

Syntax

```
authtrap (enable|disable)
```

ips{running-snmp}community

Configure SNMP read-only community.

Syntax

```
community COMMUNITY [SOURCE]
COMMUNITY     Text to identify SNMP system community
SOURCE        IP (A.B.C.D|X:X::X:X), subnet (A.B.C.D/M|X:X::X:X/M), or "default"
default       allow any IPv4/6 source
```

ips{running-snmp}delete

Delete file or configuration item.

Syntax

```
delete community (COMMUNITY|all)
delete trapsession ((A.B.C.D|X:X::X:X|FQDN) ver VERSION)|all)
delete username (USERNAME|all)
Valid entries:
community   Delete SNMP read-only community
trapsession Delete a configured trap session
username    Delete a configured user
```

ips{running-snmp}engineID

Configure SNMPv3 engine ID.

Syntax

```
engineID ENGINE-ID
ENGINE-ID SNMPv3 Engine ID (1-32 hex octets, ex: 0x800012ef0302a11aab33f4)
```

ips{running-snmp}snmp

Enable or disable SNMP.

Syntax

```
snmp (enable|disable)
```

ips{running-snmp}trapdest

Configure SNMP v2c or v3 trap destinations.

Syntax

```
trapdest HOST [port PORT] ver 2c COMMUNITY [inform]
trapdest HOST [port PORT] ver 3 USERNAME [inform]
trapdest HOST [port PORT] ver 3 USERNAME authtype AUTHTYPE AUTHPASS [inform]
trapdest HOST [port PORT] ver 3 USERNAME authtype AUTHTYPE AUTHPASS privproto

Valid entries:
HOST           IP address or DNS host name
port           Configure SNMP port
PORT           SNMP port (default 162)
ver            Configure SNMP version (2c, or 3)
2c             SNMPv2c
COMMUNITY      Text to identify SNMP system community
inform         Send information message instead of a trap
3              SNMPv3
USERNAME       Text to identify USM user name (for authentication/privacy)
level          Configure security level (noAuthNoPriv|authNoPriv/|authPriv)
noAuthNoPriv   No authentication, no privacy
authNoPriv     Authentication, no privacy
authtype       Configure authentication type (MD5|SHA)
AUTHTYPE       Authentication type
  Possible values for AUTHTYPE are:
  MD5            Message Digest 5
  SHA            Secure Hash Algorithm
AUTHPASS       Authentication passphrase - must be at least 8 characters
authPriv       Authentication and privacy
privproto      Configure privacy protocol (DES|AES)
PRIVPROTO      Privacy protocol
  Possible values for PRIVPROTO are:
  DES            Data Encryption Security
```

```
  AES             Advanced Encryption Security
PRIVPASS       Optional privacy passphrase - must be at least 8 characters
```

ips{running-snmp}username

Configure SNMPv3 USM read-only user.

Syntax

```
username USERNAME
username USERNAME authtype AUTHTYPE AUTHPASS
username USERNAME authtype AUTHTYPE AUTHPASS privproto PRIVPROTO [PRIVPASS]

Valid entries:
USERNAME         Text to identify USM user name (for authentication/privacy)
level            Configure security level (noAuthNoPriv|authNoPriv/|authPriv)
noAuthNoPriv     No authentication, no privacy
authNoPriv       Authentication, no privacy
authtype         Configure authentication type (MD5|SHA)
AUTHTYPE         Authentication type
  Possible values for AUTHTYPE are:
  MD5              Message Digest 5
  SHA              Secure Hash Algorithm
AUTHPASS         Authentication passphrase - must be at least 8 characters
authPriv         Authentication and privacy
privproto        Configure privacy protocol (DES|AES)
PRIVPROTO        Privacy protocol
  Possible values for PRIVPROTO are:
  DES              Data Encryption Security
  AES              Advanced Encryption Security
PRIVPASS         Optional privacy passphrase - must be at least 8 characters
```

running-sslinsp Context Commands

Use the **ssl-insp** context to specify the SSL sessions you want to inspect and to enable or disable SSL inspection.

Note

While SSL inspection is disabled, you can configure SSL inspection to specify the SSL sessions you want to inspect.

Syntax

```
ips{running-sslinsp}
```

ips{running-sslinsp}enable

Use the **enable** command to begin inspecting SSL sessions based on the configuration you specify. While SSL inspection is disabled, you can configure SSL inspection, but no sessions are inspected.

To enable SSL inspection, the TPS device must be licensed for SSL inspection. Use the LSM to verify the SSL inspection license.

Syntax

```
ips{running-sslinsp} [enable|disable]
```

ips{running-sslinsp}log sslInspection

Use the **`log ssllInspection`** command to save SSL inspection logging information to a particular notification contact. By default, the TPS device saves SSL inspection log information to the "Management Console" notification contact which is available for display from the LSM and is found in the *sslInspection.log* on the device.

Important

To generate SSL inspection log entries, enable logging on the SSL server for troubleshooting purposes only. By default, an SSL server does not generate logging information. See *ips{running-sslinsp}server*.

Syntax

```
log sslInspection CONTACT-NAME [ALL|none]
```

ips{running-sslinsp}profile

Add, edit, or delete an SSL inspection profile. An SSL inspection *profile* describes the encrypted traffic that you want to protect using one or more server policies. A *server policy* consists of an SSL server, and any source IP address exceptions. When you add or edit an SSL inspection profile, the CLI context changes to that profile. From the profile subcontext, view and change the default settings for that profile, for example, to add a server policy.

Note

To exit the edit configuration mode from any context, type the **`!`** command and press Enter.

When you create a new profile, you must add a policy named `mypolicy` to the profile and assign an SSL inspection server named **mysslserver** to the policy. The SSL server specifies the range of server IP addresses you want to protect along with your SSL server configuration details.

You can also update the policy to specify any source IP addresses that you do not want to inspect. Secure sessions between the server and the specified source IP addresses are not inspected.

Syntax

```
[delete] profile PROFILENAME
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}certificate	Import the certificate from your web server into the local keystore on the device.
ips{running-certificates}private-key	Import the private key from your web server into the local keystore on the device.
ips{running-vsegs-VSEG_NAME}ssl-profile	Update the virtual segment to assign the SSL inspection profile.
ips{running-sslinsp}server	Add an SSL server with its assigned security certificate and private key.

ips{running-sslinsp}server

Add or edit an SSL server to specify the SSL server configuration you want the TippingPoint security device to proxy, including the SSL service.

You must specify the type of secure traffic that is accepted on the SSL detection port. For example, if the server accepts POP3S traffic on port 2000, add an SSL server with a Detection Port of 2000 and a Decrypted Service of POP3. From the

server subcontext, you can view and change the default settings for that server. When you finish, assign the SSL server proxy to an SSL inspection profile. Enable logging on the SSL server proxy for troubleshooting purposes only.

Note

To exit the edit configuration mode from any context, type the **!** command and press Enter.

The `protocol SSL-PROTOCOL` and `cipher-suite SSL-PROTOCOL` options have "auto-" commands to allow selection of cipher suites by protocol or protocols by cipher suite, respectively. Use the "auto-" command to add or delete ciphers based on what protocol is selected and what it supports.

By default, the IP address and device certificate for the server are not defined, and must be specified separately. Specify the **IP address** of your web server by entering up to 8 IPv4 addresses (separated by commas), or by specifying a CIDR range, such as 192.168.0.1/24. Specify or delete the **device certificates** that the TPS device uses to decrypt and encrypt TLS traffic across the specified range of server IP addresses. Make sure that the corresponding private keys are assigned to the device certificates.

Syntax

```
[delete] server SERVERNAME
```

Related commands

COMMAND	DESCRIPTION
ips{running-certificates}certificate	Import the certificate from your web server into the local keystore on the device.
ips{running-certificates}private-key	Import the private key from your web server into the local keystore on the device.
ips{running-vsegs-VSEG_NAME}ssl-profile	Update the virtual segment to assign the SSL inspection profile.
ips{running-sslinsp}profile	Assign the SSL server to an SSL inspection profile.

running-traffic-management Context Commands

Immediate Commit Feature. Changes take effect immediately.

When you create a traffic profile and add traffic filters, more options become available.

ips{running-trafmgmt}delete

Delete a traffic-management profile.

Syntax

```
delete PROFILE
```

ips{running-trafmgmt}profile

Create or enter traffic-management profile context. When traffic filters are added to a profile, more options become available.

Syntax

```
  profile NEWTRAFPROFNAME
  profile TRAFPROFNAME
```

ips{running-trafmgmt}rename

Rename traffic-management profile.

Syntax

```
rename profile TRAFPROFNAME NEWTRAFPROFNAME
```

running-virtual-segments Context Commands

Physical segments have predefined virtual segments. CIDRs and profiles are applied to the virtual segment. Virtual segments enable further management of VLAN traffic. Use this context to define an individual virtual segment.

Syntax

```
ips{running}virtual-segments
ips{running-vsegs}?
Valid entries at this position are:
delete                  Delete file or configuration item
help                    Display help information
rename                  Rename virtual-segment
virtual-segment         Create or enter virtual-segment context
display                 Display file or configuration item
```

Notes

- A maximum of 64 virtual segments can be configured.
- Each virtual segment name must be unique.

ips{running-vsegs}delete virtual-segment

Delete a virtual-segment context. The position value for any higher virtual segments will be renumbered. Only user-created virtual segments can be deleted.

Syntax

```
delete virtual-segment VSEGNAME
```

ips{running-vsegs}display

Display file or configuration item.

Syntax

```
display {xml}
```

ips{running-vsegs}rename virtual-segment

Rename the virtual segment. Each virtual segment name must be unique.

Syntax

```
rename virtual-segment VSEGNAME NEWVSEGNAME
```

ips{running-vsegs}virtual-segment

Create or enter virtual-segment context.

Syntax

```
virtual-segment VSEGNAME
virtual-segment NEWVSEGNAME
```

running-virtual-segment Context Commands

Physical segments have predefined virtual segments. CIDRs and profiles are applied to the virtual segment. Virtual segments enable further management of VLAN traffic.

Syntax

```
ips{running-vsegs}virtual-segment segmentname
ips{running-vsegs-segmentname}?
Valid entries at this position are:
  bind                 Bind physical ports to virtual segment
  delete               Delete file or configuration item
  description          Update virtual segment description
  display              Display file or configuration item
  dst-address          Add destination address to a virtual segment
  help                 Display help information
  ips-profile          Virtual segment ips profile
  move                 Move virtual segment priority position
  reputation-profile   Virtual segment reputation profile
  src-address          Add source address to a virtual segment
  ssl-profile          Virtual segment SSL profile
  traffic-profile      Virtual segment traffic-management profile
  vlan-id              Add vlan id or range to virtual segment
```

Notes

- A maximum of 64 virtual segments can be configured.
- Each virtual segment name must be unique.
- You can configure up to 4094 VLAN IDs per virtual segment.
- Each VLAN ID in a range counts individually. For example, `vlan-id range 1 5` counts as five IDs.
- A CIDR counts as a single address. For example, `192.168.1.0/24` counts as one address.
- At least one traffic criteria must be defined for each virtual segment. Traffic criteria can be VLAN IDs, src-addresses, and dst-addresses.
- If no physical ports are defined on a virtual segment, the virtual segment will apply to all physical ports.
- If no VLAN IDs are defined on a virtual segment, all VLAN IDs are included.
- If no source addresses are defined, all source addresses are included. If no destination addresses are defined, all destination addresses are included.
- Position values must remain contiguous across all defined virtual segments, so there should never be a gap in the sequence.
- Position values start with `1` and increment by one for each new virtual segment added. The highest possible position value that can be configured is `64`.

ips{running-vsegs}bind

Bind physical ports to virtual-segment.

Syntax

```
bind in-port PHYSPORT out-port PHYSPORT
```

ips{running-vsegs}delete bind

Delete a port-pair association from this virtual segment.

Syntax

```
delete bind in-port EXISTING_PHYSPORT out-port EXISTING_PHYSPORT
```

ips{running-vsegs}description

Add or edit the description of a virtual segment.

Syntax

```
description TEXT
```

ips{running-vsegs}display

Display file or configuration item.

Syntax

```
display {xml}
```

ips{running-vsegs}dst-address

Associate an IPv4 or IPv6 destination address or subnet, in CIDR format, with this virtual segment.

Syntax

```
dst-address ABCD|ABCDM|XXXX|XXXXM
```

Host IP addresses will include the submasks. For example, entering `192.168.1.1` will display as `192.168.1.1/32`. You can associate a maximum of 250 destination addresses.

ips{running-vsegs}delete dst-address

Delete an IPv4 or IPv6 destination address or subnet associated with this virtual segment.

Syntax

```
delete dst-address all|ABCD|ABCDM|XXXX|XXXXM
```

If the `all` keyword is specified, all destination addresses are deleted from this virtual segment. Otherwise, specify an address.

Note

Host addresses are stored with a netmask of `/32` or `/128` for IPv4 or IPv6, respectively. Any address deletion requires that the netmask be supplied. For example, `delete dst-address 192.168.1.1/32`.

ips{running-vsegs-VSEG_NAME}ips-profile

Associate an existing IPS security profile with this virtual segment.

Syntax

```
ips-profile PROFILENAME
```

ips{running-vsegs-VSEG_NAME}delete ips-profile

Delete an existing IPS security profile associated with this virtual segment.

Syntax

```
delete ips-profile PROFILENAME
```

ips{running-vsegs-VSEG_NAME}reputation-profile

Associate an existing reputation profile with this virtual segment.

Syntax

```
reputation-profile PROFILENAME
```

ips{running-vsegs-VSEG_NAME}delete reputation-profile

Delete an existing reputation profile associated with this virtual segment.

Syntax

```
delete reputation-profile PROFILENAME
```

ips{running-vsegs-VSEG_NAME}ssl-profile

Edit the virtual segment to assign an SSL inspection profile.

Syntax

```
ssl-profile PROFILENAME
```

Related commands

COMMAND	DESCRIPTION
ips{running-sslinsp}profile	Create an SSL-inspection profile.

ips{running-vsegs-VSEG_NAME}delete ssl-profile

Delete an existing SSL inspection profile associated with this virtual segment.

Syntax

```
delete ssl-profile PROFILENAME
```

ips{running-vsegs}move

Add or edit the description of a virtual segment.

Syntax

```
move after VSEGNAME
move before VSEGNAME
move to position VALUE
```

Only user-created virtual segments can be moved.

Position values must remain contiguous across all defined virtual segments, so there should never be a gap in the sequence. Virtual segments in between the segment you are moving and the target may be renumbered. A virtual segment cannot be moved to a lower priority than a system-defined virtual segment.

VALUE must be an unsigned, non-zero integer number.

If VSEGNAME is the name of this virtual segment, the position value remains unchanged.

ips{running-vsegs}src-address

Associate an IPv4 or IPv6 source address or subnet, in CIDR format, with this virtual segment.

Syntax

```
src-address ABCD|ABCDM|XXXX|XXXXM
```

Host IP addresses will include the submasks. For example, entering `192.168.1.1` will display as `192.168.1.1/32`. You can associate a maximum of 250 source addresses.

ips{running-vsegs}delete src-address

Delete an IPv4 or IPv6 source address or subnet associated with this virtual segment.

Syntax

```
delete src-address all|ABCD|ABCDM|XXXX|XXXXM
```

If the `all` keyword is specified, all source addresses are deleted from this virtual segment. Otherwise, specify an address.

Note

Host addresses are stored with a netmask of `/32` or `/128` for IPv4 or IPv6, respectively. Any address deletion requires that the netmask be supplied. For example, `delete src-address 192.168.1.1/32`.

ips{running-vsegs-vsegname}vlan-id

Associate a single VLAN ID or a range of consecutive VLAN IDs with this virtual-segment.

Syntax

```
vlan-id VLANID_NUMBER
vlan-id range MINADDR MAXADDR
```

This command can only be used after an individual virtual segment is defined.

Valid IDs can range from 1–4094. All 4094 VLAN IDs can be used.

ips{running-vsegs}delete vlan-id

Delete a single VLAN ID or a range of consecutive VLAN IDs associated with this virtual-segment.

Syntax

```
delete vlan-id all | EXISTING_VLANIDNUMBER
delete vlan-id range MINADDR MAXADDR
```

If the `all` keyword is specified, all VLAN IDs get deleted, including any VLAN ranges. Otherwise, specify the VLAN ID to be deleted.

running-vlan-translations Context Commands

Adds or removes a VLAN translation setting. Use the **`auto-reverse`** flag to automatically create a reverse VLAN translation.

Syntax

```
ips{running-vlan-translations}help
Valid commands are:
  add-translation PORT VLANIN VLANOUT [auto-reverse]
  delete-translation PORT VLANIN
  help [full|COMMAND]
```

ips{running-vlan-translations}

Adds or removes a VLAN translation setting. The IPS creates a separate VLAN translation rule for each port you want to translate. A maximum of 8000 VLAN translation rules can be defined on a 440T or 2200T TPS. If the number of VLAN translation rules you want to commit exceed the specified limit, the device does not commit your changes.

Use the **auto-reverse** flag to automatically create a reverse VLAN translation.

Syntax

```
add-translation <PORT> <incoming VLAN ID> <outgoing VLAN ID> [auto-reverse]
```

```
delete-translation <PORT> <incoming VLAN ID>
```
